Python Dictionary

Dictionary abstraction provides a lookup table.

Each entry in a dictionary is a

`<key, value>`

pair. The *key* must be an immutable object.

The *value* can be anything.

`dictionary[key]` evaluates to the *value* associated with *key*. Running time is approximately constant!

Dictionary Example

```
>>> d = {}  
>>> d['UVa'] = 1818  
>>> d['UVa'] = 1819  
>>> d['Cambridge'] = 1209  
>>> d['UVa']  
1819  
>>> d['Oxford']
```

Create a new, empty dictionary

Add an entry: key 'UVa', value 1818

Update the value: key 'UVa', value 1819

Traceback (most recent call last):

File "<pyshell#93>", line 1, in <module>
d['Oxford']

KeyError: 'Oxford'

Computer program proves Shakespeare didn't work alone, researchers claim

Jack Malvern

400-year-old mystery of whether William Shakespeare was the author of an unattributed play about Edward III may have been solved by a computer program designed to detect plagiarism.

Sir Brian Vickers, an authority on Shakespeare at the Institute of English Studies at the University of London, believes that a comparison of phrases used in The Reign of King Edward III with Shakespeare's early works proves conclusively that the Bard wrote the play in collaboration with Thomas Kyd, one of the most popular playwrights of his day.

The professor used software called Pligiarism, developed by the University of Maastricht to detect cheating students, to compare language used in Edward III — published anonymously in 1596, when Shakespeare was 32 — with other plays of the period.

Four scenes in The Reign of King Edward III had traces of Shakespeare's hand

WEEKLY ARTS, BRIEFLY
Shakespeare Wrote It? Computer Says Yes
Compiled by Dave Kieff
Published: October 12, 2009

When not being used to bust cheating college students, a computer program that detects plagiarism may have helped show that Shakespeare, below, was an author of an unattributed play about Edward III, The Times of London reported. Brian Vickers, a professor at the Institute of English Studies at the University of London, told the newspaper that a comparison of the language in "The Reign of King Edward III," published anonymously in 1596,

Histogramming

Define a procedure histogram that takes a text string as its input, and returns a dictionary that maps each word in the input text to the number of occurrences in the text.

Useful string method: split()
outputs a list of the words in the string

```
>>> 'here we go'.split()
['here', 'we', 'go']
```

```
def histogram(text):
```

```
    d = {}
```

```
    words = text.split()
```

```
    for w in words:
```

```
        if w in d:
```

```
            d[w] = d[w] + 1
```

```
        else:
```

```
            d[w] = 1
```

```
    return d
```

```
>>> d = histogram(declaration)
>>> show_dictionary(d)
of: 79
the: 76
to: 64
and: 55
our: 25
their: 20
has: 20
for: 20
in: 18
He: 18
a: 15
these: 13
...
```

Showing the Dictionary

```
def show_dictionary(d):
```

```
    keys = d.keys()
```

```
    okeys = sorted(keys, lambda k1, k2: d[k2] - d[k1])
```

```
    for k in okeys:
```

```
        print str(k) + ": " + str(d[k])
```

Author Fingerprinting (aka Plagiarism Detection)

“The program identifies phrases of three words or more in an author’s known work and searches for them in unattributed plays. In tests where authors are known to be different, there are up to 20 matches because some phrases are in common usage. When *Edward III* was tested against Shakespeare’s works published before 1596 there were 200 matches.”

The Times, 12 October 2009

```
def phrase_collector(text, plen):
```

```
    d = {}
```

```
    words = text.split()
```

```
    words = map(lambda s: s.lower(), words)
```

```
    for windex in range(0, len(words) - plen):
```

```
        phrase = tuple(words[windex:windex+plen])
```

```
        if phrase in d:
```

```
            d[phrase] = d[phrase] + 1
```

```
        else:
```

```
            d[phrase] = 1
```

```
    return d
```

```
def histogram(text):
```

```
    d = {}
```

```
    words = text.split()
```

```
    for w in words:
```

```
        if w in d:
```

```
            d[w] = d[w] + 1
```

```
        else:
```

```
            d[w] = 1
```

```
    return d
```

Dictionary keys must be immutable: convert the (mutable) list to an immutable tuple.

```
def common_phrases(d1, d2):
```

```
    keys = d1.keys()
```

```
    common = {}
```

```
    for k in keys:
```

```
        if k in d2:
```

```
            common[k] = (d1[k], d2[k])
```

```
    return common
```

```
def get_my_homepage():
```

```
    return urlopen('http://www.cs.virginia.edu/evans/index.html').read()
```

```
>>> ptj = phrase_collector(declaration, 3)
>>> pde = phrase_collector(get_my_homepage(), 3)
>>> c = common_phrases(ptj, pde)
>>> len(c)
0
```

```
>>> pde = phrase_collector(get_my_homepage(), 2)
>>> ptj = phrase_collector(declaration, 2)
>>> c = common_phrases(ptj, pde)
>>> show_phrases(c)
('principles', 'and'): (1, 1)
('has', 'kept'): (1, 1)
('has', 'been'): (1, 1)
('and', 'our'): (1, 1)
('design', 'to'): (1, 1)
('not', 'be'): (1, 1)
('of', 'all'): (1, 1)
('they', 'have'): (1, 1)
('by', 'the'): (1, 1)
('protection', 'of'): (1, 1)
('with', 'a'): (1, 1)
('as', 'we'): (1, 1)
('is', 'the'): (2, 1)
('them', 'to'): (1, 2)
('to', 'a'): (1, 2)
('the', 'state'): (1, 2)
('people', 'to'): (1, 2)
...
('of', 'the'): (4, 12)
```

Possible Project Idea

Make a website that allows visitors to compare text samples for common phrases.

Reminder: if you want to do a “super ambitious” web application project instead of PS7, you need to convince me by Monday (November 2). You should have a team, idea for a project, and justification explaining why it is “super ambitious”.

History of Object-Oriented Programming

Object-oriented programming is an exceptionally bad idea which could only have originated in California.

Edsger Dijkstra

I don't know how many of you have ever met Dijkstra, but you probably know that arrogance in computer science is measured in nano-Dijkstras.

Alan Kay

The people who are the worst at programming are the people who refuse to accept the fact that their brains aren't equal to the task. Their egos keep them from being great programmers. The more you learn to compensate for your small brain, the better a programmer you'll be. The more humble you are, the faster you'll improve.

Edsger Dijkstra, 1972 Turing Award
