Lexical Semantics and Word Senses

Hongning Wang

CS@UVa
Today’s lecture

1. Lexical semantics
   – Meaning of words
   – Relation between different meanings

2. WordNet
   – An ontology structure of word senses
   – Similarity between words

3. Distributional semantics
   – Similarity between words
   – Word sense disambiguation
What is the meaning of a word?

• Most words have many different senses
  – dog = animal or sausage?
  – lie = to be in a horizontal position or a false statement made with deliberate intent

• What are the relations of different words in terms of meaning?
  – Specific relations between senses
    • Animal is more general than dog
  – Semantic fields
    • Money is related to bank

“a set of words grouped, referring to a specific subject ... not necessarily synonymous, but are all used to talk about the same general phenomenon” - wiki
Word senses

• What does ‘bank’ mean?
  – A financial institution
    • E.g., “US bank has raised interest rates.”
  – A particular branch of a financial institution
    • E.g., “The bank on Main Street closes at 5pm.”
  – The sloping side of any hollow in the ground, especially when bordering a river
    • E.g., “In 1927, the bank of the Mississippi flooded.”
  – A ‘repository’
    • E.g., “I donate blood to a blood bank.”
Lexicon entries

**lemma**

**senses**

---

**bank**

*noun* \bank\ 

**Definition of BANK**

1. a mound, pile, or ridge raised above the surrounding level: as
   - a: a piled-up mass of cloud or fog
   - b: an undersea elevation rising especially from the continental shelf
2. the rising ground bordering a lake, river, or sea or forming the edge of a cut or hollow
3. a: a steep slope (as of a hill)
   - b: the lateral inward tilt of a surface along a curve or of a vehicle (as an airplane) when turning
4. a protective or cushioning rim or piece

---

**bank**

*verb*

**Definition of BANK**

1. a: to raise a bank about
   - b: to cover (as a fire) with fresh fuel and adjust the draft of air so as to keep in an inactive state
   - c: to build (a curve) with the roadbed or track inclined laterally upward from the inside edge
2. to heap or pile in a bank
3. a: to drive (a ball in billiards) into a cushion
   - b: to bounce (a ball or shot) off a surface (as a backboard) into or toward a goal \bank\ in a rebound
4. to form or group in a tier
Some terminologies

- **Word forms**: runs, ran, running; good, better, best
  - Any, possibly inflected, form of a word
- **Lemma** (citation/dictionary form): run; good
  - A basic word form (e.g. infinitive or singular nominative noun) that is used to represent all forms of the same word
- **Lexeme**: RUN(V), GOOD(A), BANK¹(N), BANK²(N)
  - An abstract representation of a word (and all its forms), with a part-of-speech and a set of related word senses
  - Often just written (or referred to) as the lemma, perhaps in a different FONT
- **Lexicon**
  - A (finite) list of lexemes
Make sense of word senses

• Polysemy
  – A lexeme is polysemous if it has different related senses

bank = financial institution or a building
Make sense of word senses

• Homonyms
  – Two lexemes are homonyms if their senses are unrelated, but they happen to have the same spelling and pronunciation

bank = financial institution or river bank
Relations between senses

• Symmetric relations
  – Synonyms: couch/sofa
    • Two lemmas with the same sense
  – Antonyms: cold/hot, rise/fall, in/out
    • Two lemmas with the opposite sense

• Hierarchical relations:
  – Hypernyms and hyponyms: pet/dog
    • The hyponym (dog) is more specific than the hypernym (pet)
  – Holonyms and meronyms: car/wheel
    • The meronym (wheel) is a part of the holonym (car)
WordNet

• A very large lexical database of English:
  – 117K nouns, 11K verbs, 22K adjectives, 4.5K adverbs
• Word senses grouped into synonym sets ("synsets") linked into a conceptual-semantic hierarchy
  – 82K noun synsets, 13K verb synsets, 18K adjectives synsets, 3.6K adverb synsets
  – Avg. # of senses: 1.23/noun, 2.16/verb, 1.41/adj, 1.24/adverb
• Conceptual-semantic relations
  – hypernym/hyponym
A WordNet example

• http://wordnet.princeton.edu/

WordNet Search - 3.1
- WordNet home page - Glossary - Help

Word to search for: bank
Search WordNet

Display Options: (Select option to change) ▼ Change

Key: "S:" = Show Synset (semantic) relations, "W:" = Show Word (lexical) relations
Display options for sense: (gloss) "an example sentence"

Noun

• S: (n) bank (sloping land (especially the slope beside a body of water)) "they pulled the canoe up on the bank", "he sat on the bank of the river and watched the currents"
• S: (n) depository financial institution, bank, banking concern, banking company (a financial institution that accepts deposits and channels the money into lending activities) "he cashed a check at the bank", "that bank holds the mortgage on my home"
• S: (n) bank (a long ridge or pile) "a huge bank of earth"
• S: (n) bank (an arrangement of similar objects in a row or in tiers) "he operated a bank of switches"
• S: (n) bank (a supply or stock held in reserve for future use (especially in emergencies))
• S: (n) bank (the funds held by a gambling house or the dealer in some gambling games) "he tried to break the bank at Monte Carlo"
• S: (n) bank, cant, cambier (a slope in the turn of a road or track, the outside is higher than the inside in order to reduce the effects of centrifugal force)
Hierarchical synset relations: nouns

• **Hypernym/hyponym** (between concepts)
  – The more general ‘meal’ is a hypernym of the more specific ‘breakfast’

• **Instance hypernym/hyponym** (between concepts and instances)
  – Austen is an instance hyponym of author

• **Member holonym/meronym** (groups and members)
  – professor is a member meronym of (a university’s) faculty

• **Part holonym/meronym** (wholes and parts)
  – wheel is a part meronym of (is a part of) car.

• **Substance meronym/holonym** (substances and components)
  – flour is a substance meronym of (is made of) bread
WordNet hypernyms & hyponyms

- **S:** (n) bank (sloping land (especially the slope beside a body of water))
  - **direct hyponym** / **full hyponym**
    - **S:** (n) riverbank, riverside (the bank of a river)
    - **S:** (n) waterside (land bordering a body of water)
  - **direct hypernym** / **inherited hypernym** / **sister term**
    - **S:** (n) slope, incline, side (an elevated geological formation)
  - **derivationally related form**
- **S:** (n) depository financial institution, bank, banking concern, banking company (a financial institution that accepts deposits and channels the money into lending activities)
  - **direct hyponym** / **full hyponym**
    - **S:** (n) credit union (a cooperative depository financial institution whose members can obtain loans from their combined savings)
      - **direct hypernym** / **inherited hypernym** / **sister term**
        - **S:** (n) depository financial institution, bank, banking concern, banking company (a financial institution that accepts deposits and channels the money into lending activities)
  - **S:** (n) Federal Reserve Bank, reserve bank (one of 12 regional banks that monitor and act as depositories for banks in their region)
  - **S:** (n) agent bank (a bank that acts as an agent for a foreign bank)
  - **S:** (n) commercial bank, full service bank (a financial institution that accepts demand deposits and makes loans and provides other services for the public)
Hierarchical synset relations: verbs

• Hypernym/troponym (between events)
  – travel/fly, walk/stroll
  – Flying is a troponym of traveling: it denotes a specific manner of traveling

• Entailment (between events):
  – snore/sleep
    • Snoring entails (presupposes) sleeping
WordNet similarity

• Path based similarity measure between words
  – Shortest path between two concepts (Leacock & Chodorow 1998)
    • \( \text{sim} = \frac{1}{|\text{shortest path}|} \)
  – Path length to the root node from the least common subsumer (LCS) of the two concepts (Wu & Palmer 1994)
    • \( \text{sim} = \frac{2 \times \text{depth}(\text{LCS})}{\text{depth}(w_1) + \text{depth}(w_2)} \)

## WordNet::Similarity

Distributional hypothesis

• What is tezgüino?
  – A bottle of tezgüino is on the table.
  – Everybody likes tezgüino.
  – Tezgüino makes you drunk.
  – We make tezgüino out of corn.

• The contexts in which a word appears tell us a lot about what it means
Distributional semantics

• Use the contexts in which words appear to measure their similarity
  – Assumption: similar contexts => similar meanings
  – Approach: represent each word $w$ as a vector of its contexts $c$
    • Vector space representation
    • Each dimension corresponds to a particular context $c_n$
    • Each element in the vector of $w$ captures the degree to which the word $w$ is associated with the context $c_n$
  – Similarity metric
    • Cosine similarity
How to define the contexts

• Nearby words
  – \( w \) appears near \( c \) if \( c \) occurs within \( \pm k \) words of \( w \)
    • It yields fairly broad thematic relations
  – Decide on a fixed vocabulary of \( N \) context words \( c_1 \ldots c_N \)
    • Prefer words occur frequently enough in the corpus but not too frequent (i.e., avoid stopwords)
  – Co-occurrence count of word \( w \) and context \( c \) as the corresponding element in the vector
    • Pointwise Mutual Information (PMI)

• Grammatical relations
  – How often is \( w \) used as the subject of the verb \( c \)?
  – Fine-grained thematic relations
Mutual information

- Relatedness between two random variables

\[ I(X; Y) = \sum_{y \in Y} \sum_{x \in X} p(x, y) \log\left( \frac{p(x, y)}{p(x)p(y)} \right) \]
Pointwise mutual information

- PMI between $w$ and $c$ using a fixed window of $\pm k$ words

\[
PMI(w; c) = p(w, c) \log \left( \frac{p(w, c)}{p(w)p(c)} \right)
\]

- How often $w$ and $c$ co-occur inside a window
- How often $w$ occurs
- How often $c$ occurs
- within a sentence
Word sense disambiguation

• What does this word mean?
  – This plant needs to be watered each day.
    • living plant
  – This plant manufactures 1000 widgets each day.
    • factory

• Word sense disambiguation (WSD)
  – Identify the sense of content words (noun, verb, adjective) in context (assuming a fixed inventory of word senses)
Dictionary-based methods

• A dictionary/thesaurus contains glosses and examples of a word

bank\(^1\)

**Gloss**: a financial institution that accepts deposits and channels the money into lending activities

**Examples**: “he cashed the check at the bank”, “that bank holds the mortgage on my home”

bank\(^2\)

**Gloss**: sloping land (especially the slope beside a body of water)

**Examples**: “they pulled the canoe up on the bank”, “he sat on the bank of the river and watched the current”
Lesk algorithm

• Compare the context with the dictionary definition of the sense
  – Construct the signature of a word in context by the signatures of its senses in the dictionary
    • Signature = set of context words (in examples/gloss or in context)
  – Assign the dictionary sense whose gloss and examples are the most similar to the context in which the word occurs
    • Similarity = size of intersection of context signature and sense signature
Sense signatures

**bank**¹

**Gloss:** a financial institution that accepts deposits and channels the money into lending activities

**Examples:** "he cashed the check at the bank", "that bank holds the mortgage on my home"

**Signature**(*bank¹*) = \{financial, institution, accept, deposit, channel, money, lend, activity, cash, check, hold, mortgage, home\}

**bank**²

**Gloss:** sloping land (especially the slope beside a body of water)

**Examples:** "they pulled the canoe up on the bank", "he sat on the bank of the river and watched the current"

**Signature**(*bank¹*) = \{slope, land, body, water, pull, canoe, sit, river, watch, current\}
Signature of target word

“The bank refused to give me a loan.”

• Simplified Lesk
  – Words in context
  – \( \text{Signature(bank)} = \{\text{refuse, give, loan}\} \)

• Original Lesk
  – Augmented signature of the target word
  – \( \text{Signature(bank)} = \{\text{refuse, reject, request,... , give, gift, donate,... loan, money, borrow,...}\} \)
Learning-based Methods

• Will be discussed in the lecture of “Text Categorization”
  – Basically treat each sense as an independent class label
  – Construct classifiers to assign each instance with context into the classes/senses
What you should know

• Lexical semantics
  – Relationship between words
  – WordNet

• Distributional semantics
  – Similarity between words
  – Word sense disambiguation
Today’s reading

• Speech and Language Processing
  – Chapter 19: Lexical Semantics
  – Chapter 20: Computational Lexical Semantics
