max flow

1. what is the general approach to solving a max-flow problem?

finding augmenting paths in residual graphs.

2. when FF finishes, how do we know the answer is correct?

Because we can identify a cut associated with the resulting flow such that  $|f| = ||S, T||$ .

By max-flow-min cut thm, this  $\Rightarrow f$  is max.  
userid:

# Max flow

Min Cut

# FORD-FULKERSON

INITIALIZE

$$\underline{f(u, v) \leftarrow 0 \forall u, v}$$

WHILE EXISTS AN AUGMENTING PATH  $p$  IN  $G_f$

$$\underline{\text{AUGMENT } f \text{ WITH } c_f(p) = \min_{(u,v) \in p} \underline{c_f(u, v)}}$$

# WHY DOES FF WORK? (HIGH LEVEL)

# EDMONDS-KARP

INITIALIZE  $f(u, v) \leftarrow 0 \forall u, v$

WHILE EXISTS AN AUGMENTING PATH  $p$  IN  $G_f$  (use BFS to find it)

AUGMENT  $f$  WITH  $c_f(p) = \min_{(u,v) \in p} c_f(u, v)$

FOR EVERY AUGMENTING PATH, SOME EDGE IS **CRITICAL**.

**CRITICAL** EDGES ARE REMOVED IN NEXT RESIDUAL GRAPH.

KEY IDEA: HOW MANY TIMES CAN AN EDGE BE **CRITICAL**?

$\uparrow$

$e = (u, v)$

time  $t$ ,  $spse$

$e$  becomes  
critical

$\uparrow$

time

$k$  is

the 2nd time

that

$e = (x, y)$  becomes critical

# Outline of the argument

first time  $(u,v)$  is critical:

time  $i+1$ :  $(u,v)$  is critical:

$$\delta_{i+1}(s, v) \geq \delta_i(s, u) + 1$$

**time  $j$ :** Edge  $(u,v)$  STRIKES BACK

time  $i+1$ :  $(u,v)$  is critical:

$$\delta_{i+1}(s, v) \geq \delta_i(s, u) + 1$$

**time j**: Edge  $(u,v)$  STRIKES BACK

$$\delta_j(s, u) = \delta_j(s, v) + 1$$

**time j:** Edge (u,v) STRIKES BACK

$$\delta_{i+1}(s, v) \geq \delta_i(s, u) + 1$$

$$\delta_j(s, u) = \delta_j(s, v) + 1$$

time  $k$ : RETURN OF THE  $(u,v)$  critical

$$\delta_k(s, u) \geq \delta_i(s, u) + 2$$

**QUESTION:** How many times can  $(u,v)$  be critical?

$\Rightarrow$  edge  $e$  can become critical  $\leq \frac{\sqrt{V}}{2}$  times

b/c after  $\frac{\sqrt{V}}{2}$  times  $d(s, u) \rightarrow V$ ,

thus  $e$  cannot be on a simple path from  $s \rightsquigarrow t$ .

edge critical only  $\frac{V}{2}$  times.

there are only  $E$  edges.

ergo, total # of augmenting paths:

$$\frac{EV}{2}$$

time to find an augmenting path:

$$\Theta(E+U) \quad (\text{BFS})$$

total running time of E-K algorithm:

$$\Theta(E^2U)$$

augmenting path.

ff

$$O(E|f^*|)$$

ek2

$$\Theta(E^2V)$$

push-relabel

$$\Theta(EV^2)$$

faster push-relabel

$$\Theta(V^3)$$

# APPLICATIONS OF MAX FLOW

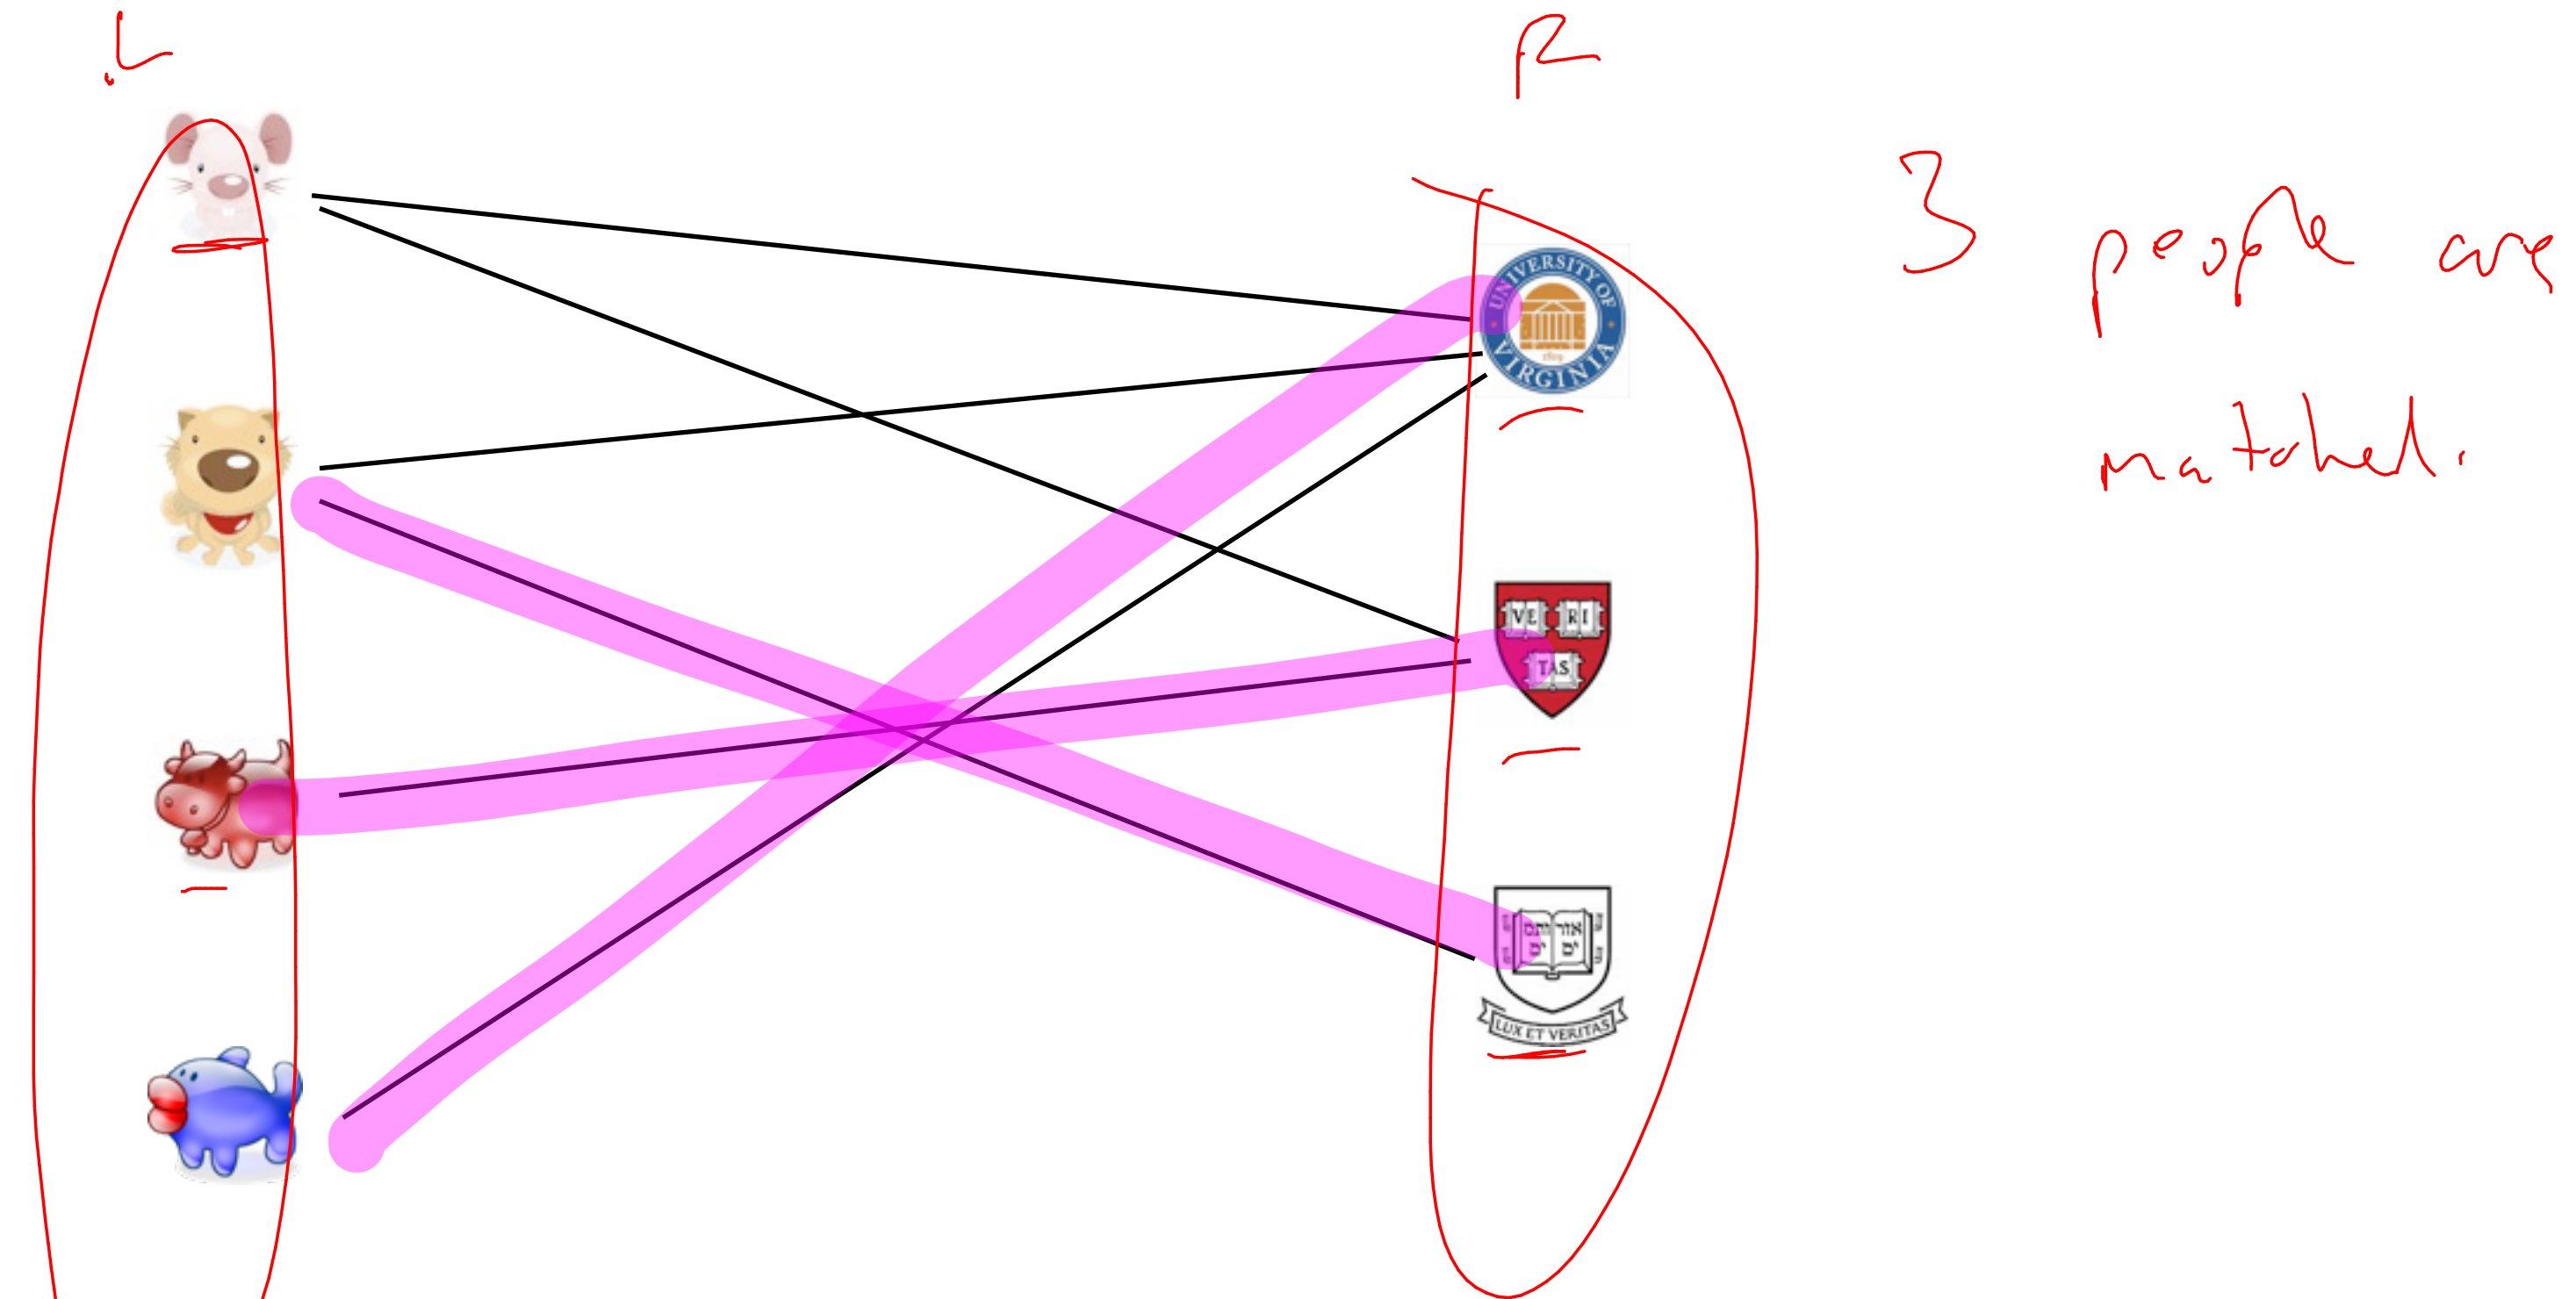

# Bipartite Matchings

# MAXIMUM BIPARTITE MATCHING

2 people matched

# MAXIMUM BIPARTITE MATCHING

$$M = \{ (f, uva), (c, H), (d, y) \}$$

# BIPARTITE MATCHING

PROBLEM:

Given a graph  $(L, R, E)$ , find the largest set

of edges  $M \subseteq E$  such that

each vertex is incident to at most

one edge in  $M$ .

# ALGORITHM

- ① Transform  $G \rightarrow G'$
- ② Run MAXFLOW
- ③ output the middle edges with flow  $f(e) = 1$

- ①  $\Theta(V)$
- ②  $\text{---}$
- ③  $\Theta(E + V)$

# ALGORITHM

1. MAKE NEW  $G'$   
FROM INPUT  $G$ .
2. RUN FF ON  $G'$
3. OUTPUT ALL MIDDLE EDGES  
WITH FLOW  $F(E)=I$ .

Why does this work??

Need to show:

$G$  has a <sup>maximal</sup> matching  $|M| = k \iff G'$  has maxFlow  $k$ .

# CORRECTNESS

IF  $G$  HAS A MATCHING OF SIZE  $K$ , THEN  $G$  has a flow of  $K$ .

① for each edge  $e = (x, y) \in M$ , set  $f(e) = 1$  in  $G$ .

$$\underline{f(s, x) = 1}$$

$$\underline{f(y, t) = 1}$$

② Verify that this is a flow.

flow constraint ✓

capacity constraint

$|M| = K \Rightarrow$  outgoing flow from  $S$  is  $K$

$\Rightarrow |f| = K.$

# CORRECTNESS

IF  $\underline{G'}$  HAS A FLOW OF  $\underline{K}$ , THEN

$G$  has a matching of size  $K$ .

tricky example:

flow of 1 unit.

$C(e) = 1$  for all edges.

# INTEGRALITY THEOREM

IF CAPACITIES ARE ALL INTEGRAL, THEN  $\exists$  a MAXFLOW <sup>that</sup> will be integral  
(i.e. all flow values will be integers)

Why is this true??

Consider what FF does. At the start, capacities + flow are integral.

Spse this is true for the first  $k$  iterations of the FF loop.

On the next loop, the augmenting path will have an integer as the bottleneck edge:

$\Rightarrow$  next residual graph will have integral capacities.

$\Rightarrow$  flow will be integral

# CORRECTNESS

IF  $G'$  HAS A FLOW OF  $K$ , THEN  $G$  HAS  $K$ -MATCHING.

$\implies \exists$  an integral flow with value  $\underline{K}$ .

$\implies$  since capacities are 1, then the  $f(e) = 0$  or  $\underline{1}$

$\implies$  Now, consider all middle edges  $e = (x, y)$  s.t.  $f(e) = 1$

$$M = \{ \underline{e} \mid f(e) = 1 \ \& \ e = (\underline{x}, y) \}$$

$|M| = K$  & that  $M$  is a matching

properties of flow,

flow constraint.

only one edge from  $S$  to  $x \implies$

only one edge  
in  $M$  that  
touches  $x$ .

# RUNNING TIME

$$\Theta(\underline{EV})$$

$$EV \quad \underline{\underline{E^2V}}$$

MAX flow  $|f| \leq V$ , by ff ANALYSIS, the

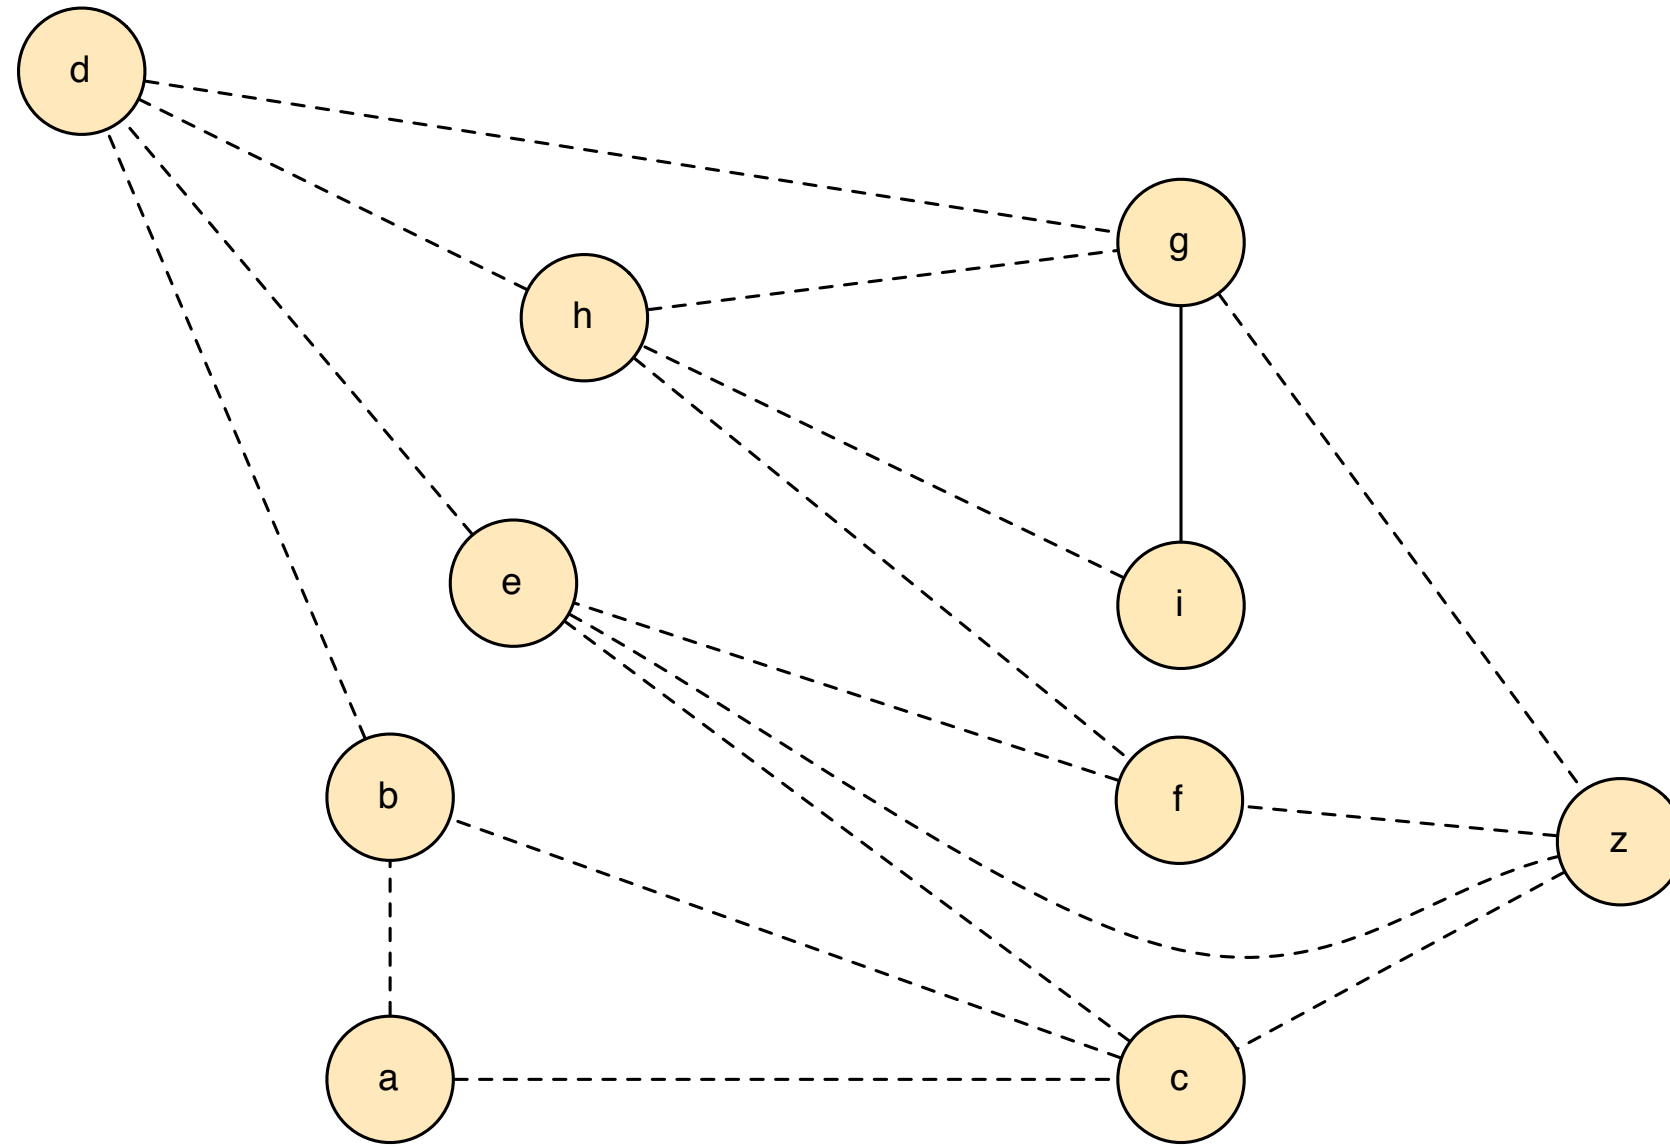

running time is  $\Theta(E \cdot f^*)$

$$\Rightarrow \Theta(E \cdot V)$$

# EDGE-DISJOINT PATHS

# ALGORITHM

# ANALYSIS

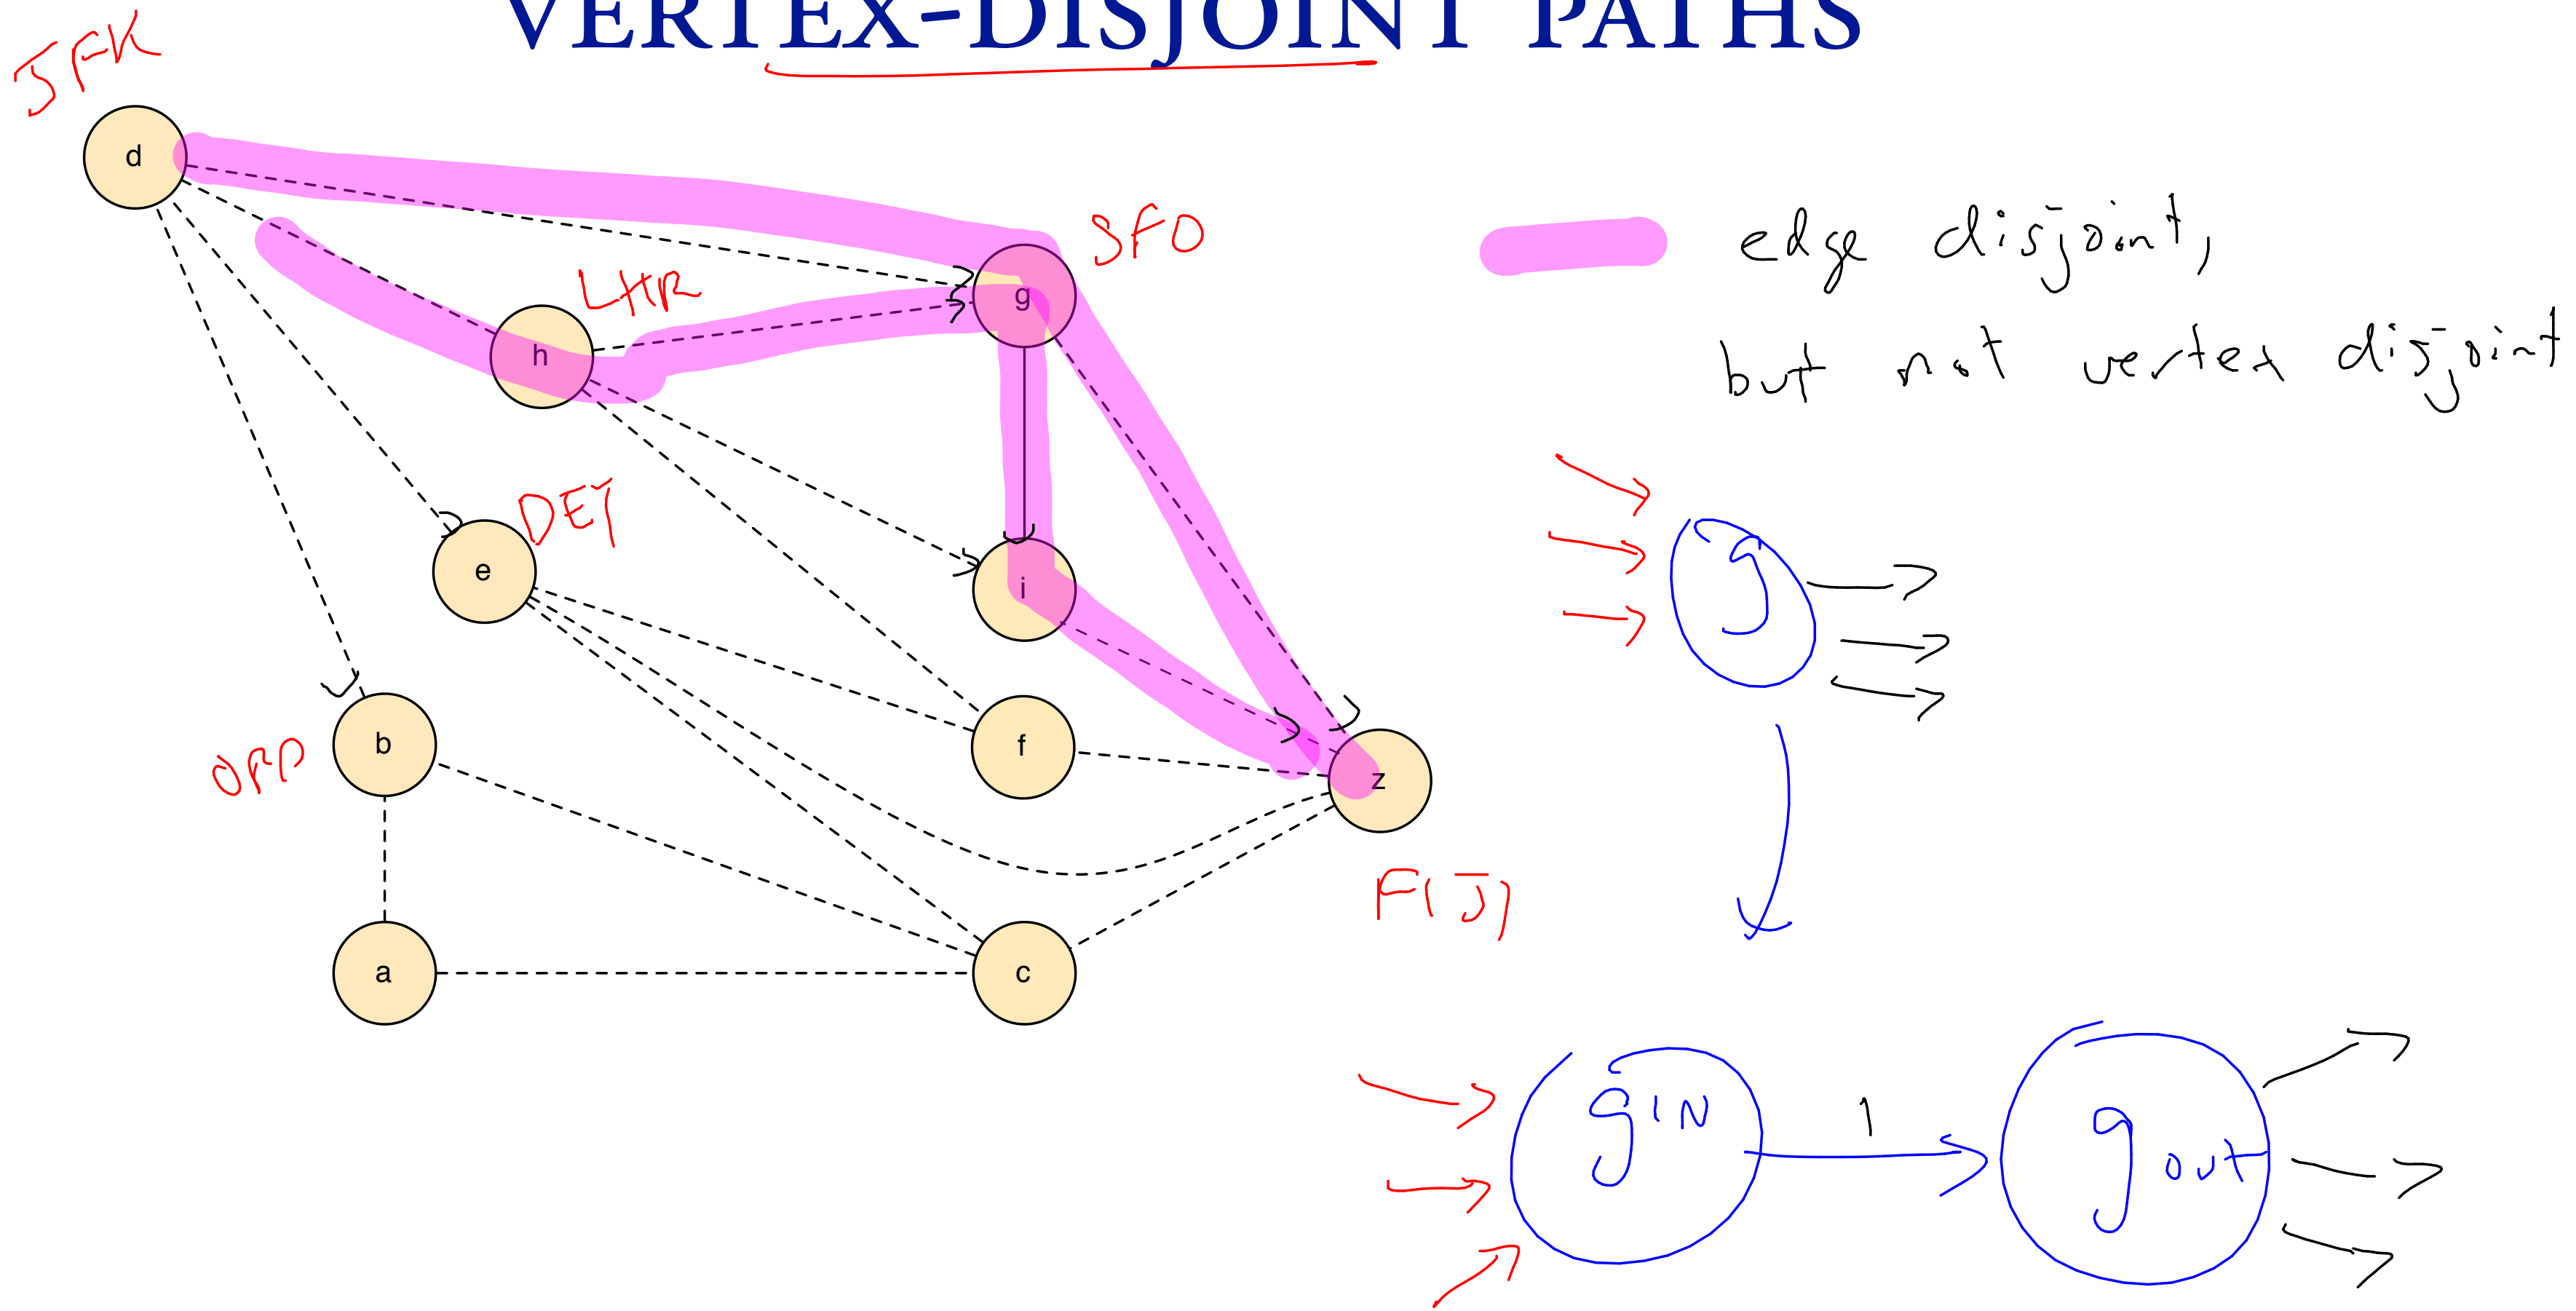

IF  $G$  HAS  $k$  DISJOINT PATHS, THEN  $G'$  has a flow with value  $k$ .

If  $G'$  has a flow of value  $k$ ,  $\Rightarrow \exists k$  disjoint paths from  $s$  to  $t$ .

# ANALYSIS

IF  $G'$  HAS A FLOW OF  $K$ , THEN

# VERTEX-DISJOINT PATHS
