Lecture 10: Supervised Classification with Support Vector Machine

Dr. Yanjun Qi

University of Virginia

Department of Computer Science
Where are we?

Five major sections of this course

- Regression (supervised)
- Classification (supervised)
- Unsupervised models
- Learning theory
- Graphical models
Today

- Supervised Classification
- Support Vector Machine (SVM)
e.g. SUPERVISED LEARNING

• Find function to map input space $X$ to output space $Y$

\[ f : X \rightarrow Y \]

• So that the difference between $y$ and $f(x)$ of each example $x$ is small.

\[ \begin{array}{c}
\text{Input } X : \text{ e.g. a piece of English text} \\
\text{Output } Y: \{1 / \text{Yes}, -1 / \text{No}\}
\end{array} \]

e.g.

I believe that this book is not at all helpful since it does not explain thoroughly the material. It just provides the reader with tables and calculations that sometimes are not easily understood ...

\[ y \rightarrow -1 \]

Output Y: \{1 / Yes, -1 / No\}

e.g. Is this a positive product review?
A Dataset for classification

\[ f : \begin{pmatrix} X \\ \end{pmatrix} \rightarrow \begin{pmatrix} Y \\ \end{pmatrix} \]

- **Data/points/instances/examples/samples/records**: [rows]
- **Features/attributes/dimensions/independent variables/covariates/predictors/regressors**: [columns, except the last]
- **Target/outcome/response/label/dependent variable**: special column to be predicted [last column]
e.g. SUPERVISED Linear Binary Classifier

\[ f(x, w, b) = \text{sign}(w^T x + b) \]

- \( w x + b > 0 \) denotes +1 point
- \( w x + b < 0 \) denotes -1 point
- \( w x + b = 0 \) denotes future points

Application 2: Cancer Classification using gene expression

\[ X \rightarrow Y \]

$N$ patient blood samples

$p$ genes’ quantities in blood cell
Application 3: – Text Documents, e.g. Google News

Dr. Yanjun Qi / UVA CS 6316 / f16
Text Document Representation

• Each document becomes a ‘term' vector,
  – each term is an (attribute) of the vector,
  – the value of each describes the number of times the corresponding term occurs in the document.

Bag of ‘words’
Text Categorization

- Pre-given categories and labeled document examples (Categories may form hierarchy)
- Classify new documents
- A standard supervised learning problem

\[
\hat{y} = f(x)
\]
Examples of Text Categorization

• News article classification
• Meta-data annotation
• Automatic Email sorting
• Web page classification
Application 4: – Objective recognition / Image Labeling (Label Images into predefined classes)

<table>

Image Representation for
– Objective recognition

• Image representation ➞ bag of “visual words”

An object image:
histogram of visual vocabulary – a numerical vector of D dimensions.
\( \Theta \) is defined as:

\[
\begin{align*}
& W_1 \\
& W_2 \\
& W_3 \\
& \ldots \\
& W_0
\end{align*}
\]
Application 5: – Audio Classification

- Real-life applications:
  - Customer service phone routing
  - Voice recognition software
Music Information Retrieval Systems
e.g., Automatic Music Classification

• Many areas of research in music information retrieval (MIR) involve using computers to classify music in various ways
  – Genre or style classification
  – Mood classification
  – Performer or composer identification
  – Music recommendation
  – Playlist generation
  – Hit prediction
  – Audio to symbolic transcription
  – etc.

• Such areas often share similar central procedures
Music Information Retrieval Systems
e.g., Automatic Music Classification

• Musical data collection
  – The instances (basic entities) to classify
  – Audio recordings, scores, cultural data, etc.

• Feature extraction
  – Features represent characteristic information about instances
  – Must provide sufficient information to segment instances among classes (categories)

• Machine learning
  – Algorithms ("classifiers" or "learners") learn to associate feature patterns of instances with their classes
Audio, Types of features

- Low-level
  - Associated with signal processing and basic auditory perception
  - e.g. spectral flux or RMS
  - Usually not intuitively musical

- High-level
  - Musical abstractions
  - e.g. meter or pitch class distributions

- Cultural
  - Sociocultural information outside the scope of auditory or musical content
  - e.g. playlist co-occurrence or purchase correlations
Where are we?

Three major sections for classification

- We can divide the large variety of classification approaches into roughly three major types

1. Discriminative
   - directly estimate a decision rule/boundary
   - e.g., support vector machine, decision tree, logistic regression

2. Generative:
   - build a generative statistical model
   - e.g., Bayesian networks, Naïve Bayes classifier

3. Instance based classifiers
   - Use observation directly (no models)
   - e.g. K nearest neighbors
A study comparing Classifiers

An Empirical Comparison of Supervised Learning Algorithms

Rich Caruana
Alexandru Niculescu-Mizil

Department of Computer Science, Cornell University, Ithaca, NY 14853 USA

Abstract

A number of supervised learning methods have been introduced in the last decade. Unfortunately, the last comprehensive empirical evaluation of supervised learning was the Statlog Project in the early 90’s. We present a large-scale empirical comparison between ten supervised learning methods: SVMs, neural nets, logistic regression, naive bayes, memory-based learning, random forests, decision trees, bagged trees, boosted trees, and boosted stumps. We also examine the effect that calibrating the models via Platt Scaling and Isotonic Regression has on their performance. An important aspect of our study is the use of a variety of performance criteria to

This paper presents results of a large-scale empirical comparison of ten supervised learning algorithms using eight performance criteria. We evaluate the performance of SVMs, neural nets, logistic regression, naive bayes, memory-based learning, random forests, decision trees, bagged trees, boosted trees, and boosted stumps on eleven binary classification problems using a variety of performance metrics: accuracy, F-score, Lift, ROC Area, average precision, precision/recall break-even point, squared error, and cross-entropy. For each algorithm we examine common variations, and thoroughly explore the space of parameters. For example, we compare ten decision tree styles, neural nets of many sizes, SVMs with many kernels, etc.

Because some of the performance metrics we examine internat model predictions as probabilities and mod

<td>FN</td>
</tr>
</tbody>
</table>

Precision: TP : true positive
Recall: FP : false positive
\[ \text{Accuracy} = \frac{\text{Correct Predicted}}{\text{All test Examples}} = \frac{TP + TN}{TP + FP + TN + FN} \]

\[
\begin{align*}
\text{Precision - Pos} &= \frac{TP}{P} \\
\text{Recall - Pos} &= \frac{TP}{TP + FN}
\end{align*}
\]

\[ F_1 = \frac{2 \times \text{Rec} \times \text{Prec}}{\text{Rec} + \text{Prec}} \]
Ratio of Positive Class (binary case)

If \( \frac{\text{Actual P}}{\text{AP + AN}} \) is very small (e.g. < 1/2)

\[ (1, 99) \]

\( \Rightarrow \) a classifier can predict every example as Neg

\[ \begin{array}{c|c|c}
\text{predict P} & \text{AP} & \text{AN} \\
0 & 0 & 99 \\
\text{predict N} & 1 & 99 \\
\end{array} \]

\[ \Rightarrow \text{Accuracy} = \frac{99}{100} = 0.99 \]

\[ \Rightarrow \text{Balanced Acc} = \]
1. Balanced Acc = \( \frac{1}{2} \left( \frac{TP}{P} + \frac{TN}{N} \right) \)

\[ = \frac{1}{2} \left( \frac{0}{0 + 3} + \frac{99}{100} \right) = 0.495 \]

2. Another classifier

<table>

<td>99</td>
</tr>
</tbody>
</table>

Balanced Acc = \( \frac{1}{2} \left( \frac{1}{1} + \frac{99}{99} \right) = 1 \)

Acc = \( \frac{1 + 99}{1 + 0 + 99 + 0} = 1 \)
Today

- Supervised Classification
- Support Vector Machine (SVM)
  - History of SVM
  - Large Margin Linear Classifier
  - Define Margin (M) in terms of model parameter
  - Optimization to learn model parameters \((w, b)\)
  - Linearly Non-separable case
  - Optimization with dual form
  - Nonlinear decision boundary
  - Multiclass SVM
History of SVM

- SVM is inspired from statistical learning theory [3]
- SVM was first introduced in 1992 [1]
- SVM becomes popular because of its success in handwritten digit recognition (1994)
  - 1.1% test error rate for SVM. This is the same as the error rates of a carefully constructed neural network, LeNet 4.
    - Section 5.11 in [2] or the discussion in [3] for details
- SVM is now regarded as an important example of “kernel methods”, arguably the hottest area in machine learning 20 years ago

Applications of SVMs

- Computer Vision
- Text Categorization
- Ranking (e.g., Google searches)
- Handwritten Character Recognition
- Time series analysis
- Bioinformatics
- ..........

→ Lots of very successful applications!!!
Handwritten digit recognition

\[ \rightarrow \text{MNIST (SVM)} \]

<table>
<thead>
<tr>
<th>0</th>
<th>1</th>

<td>9</td>
</tr>
</tbody>
</table>

3-nearest-neighbor = 2.4% error
400–300–10 unit MLP = 1.6% error
LeNet: 768–192–30–10 unit MLP = 0.9% error

Best (kernel machines, vision algorithms) \( \approx \) 0.6% error

In 90s, SVM achieves the

\[ \rightarrow \text{ImageNet (Deep NN)} \]
A Dataset for binary classification

\[ f : \{X\} \rightarrow \{Y\} \]

- **Data/points/instances/examples/samples/records**: [rows]
- **Features/attributes/dimensions/independent variables/covariates/predictors/regressors**: [columns, except the last]
- **Target/outcome/response/label/dependent variable**: special column to be predicted [last column]
Binary Classification

\[ y \in \{-1, 1\} \]

\[ \text{if } x \in \mathbb{R} \]

Boundary: \( w^T x + b = 0 \)

\[ x = - \frac{b}{w} \]

\[ \text{if } x \in \mathbb{R}^2 \]

Regression

\[ y \in \mathbb{R} \]

\[ \text{if } x \in \mathbb{R}^p \]

\[ y = w^T x + b \]

\[ y = w^2 x + b \quad \text{if } x \in \mathbb{R}^p \]
Affine hyperplanes

- any hyperplane can be given in coordinates as the solution of a single linear (algebraic) equation of degree 1.

\[a_1 x_1 + a_2 x_2 + a_3 x_3 + \ldots + a_p x_p = b\], at least one \( a_i \neq 0 \)

\[\Rightarrow \text{e.g. classification Boundary } \quad W^T x + b = 0\]

\[\begin{cases} x \in \mathbb{R}^p \\ b \in \mathbb{R} \end{cases}\]
Review:
Vector Product, Orthogonal, and Norm

For two vectors \( x \) and \( y \),
\[
x^T y
\]
is called the (inner) vector product.

\( x \) and \( y \) are called orthogonal if
\[
x^T y = 0
\]

The square root of the product of a vector with itself,
\[
\sqrt{x^T x}
\]
is called the 2-norm ( \( |x|_2 \) ), can also write as \( |x| \)

Linear Classifiers

\[ f(x) \]

- • denotes +1
- ○ denotes -1

How would you classify this data?
Linear Classifiers

How would you classify this data?
Linear Classifiers

How would you classify this data?

denotes +1
denotes -1
Linear Classifiers

$\mathbf{x} \rightarrow f \rightarrow y^{\text{est}}$

- $\mathbf{x}$ denotes $+1$
- $\mathbf{y}$ denotes $-1$

How would you classify this data?
Linear Classifiers

\[ f \]

\[ x \]

\[ y_{\text{est}} \]

- Denotes +1
- Denotes -1

Any of these would be fine..

..but which is best?
Define the margin of a linear classifier as the width that the boundary could be increased by before hitting a datapoint.
The maximum margin linear classifier is the linear classifier with the maximum margin. This is the simplest kind of SVM (Called an LSVM)
The **maximum margin linear classifier** is the linear classifier with the maximum margin. This is the simplest kind of SVM (Called an LSVM)

- \( f(x) = \Sigma w_i x_i + b \) denotes +1
- \( f(x) = \Sigma w_i x_i + b \) denotes -1

Support Vectors are those datapoints that the margin pushes up against.
The maximum margin linear classifier is the linear classifier with the maximum margin. This is the simplest kind of SVM (Called an LSVM).

\[ f(x, w, b) = \text{sign}(w^T x + b) \]

**Support Vectors** are those datapoints that the margin pushes up against.

- denotes +1
- denotes -1

**Linear SVM**
Max margin classifiers

• Instead of fitting all points, focus on boundary points
• Learn a boundary that leads to the largest margin from both sets of points

From all the possible boundary lines, this leads to the largest margin on both sides
Max margin classifiers

• Instead of fitting all points, focus on boundary points
• Learn a boundary that leads to the largest margin from points on both sides

Why?
• Intuitive, ‘makes sense’
• Some theoretical support
• Works well in practice
Max margin classifiers

- Instead of fitting all points, focus on boundary points
- Learn a boundary that leads to the largest margin from points on both sides

Also known as linear support vector machines (SVMs)

These are the vectors supporting the boundary
Max-margin & Decision Boundary

- The decision boundary should be as far away from the data of both classes as possible.

\[ w^T x + b = -1 \]
\[ w^T x + b = 0 \]
\[ w^T x + b = 1 \]

1. Correctly classifies all points
2. Maximizes the margin (or equivalently minimizes \( w^T w \))

\( W \) is a p-dim vector; \( b \) is a scalar.

Class -1

Class 1
Specifying a max margin classifier

- Predict class +1 if $w^T x + b \geq 1$
- Predict class -1 if $w^T x + b \leq -1$
- Undefined if $-1 < w^T x + b < 1$

Class $+1$ plane boundary
Class $-1$ plane

$w^T x + b = +1$
$w^T x + b = 0$
$w^T x + b = -1$
Specifying a max margin classifier

\[ w^T x + b = +1 \]
\[ w^T x + b = 0 \]
\[ w^T x + b = -1 \]

Classify as +1 if \( w^T x + b \geq 1 \)
Classify as -1 if \( w^T x + b \leq -1 \)
Undefined if \(-1 < w^T x + b < 1 \)

Is the linear separation assumption realistic?
We will deal with this shortly, but let's assume it for now.
Today

- Supervised Classification
- Support Vector Machine (SVM)
  - History of SVM
  - Large Margin Linear Classifier
  - Define Margin (M) in terms of model parameter
  - Optimization to learn model parameters (w, b)
  - Linearly Non-separable case
  - Optimization with dual form
  - Nonlinear decision boundary
  - Multiclass SVM
Maximizing the margin

Let define the width of the margin by \( M \).

How can we encode our goal of maximizing \( M \) in terms of our parameters \((w, b)\)?

Let's start with a few observations:

Classify as +1 if \( w^T x + b \geq 1 \)

Classify as -1 if \( w^T x + b \leq -1 \)

Undefined if \(-1 < w^T x + b < 1\)
Margin $M$

Predict class $+1$ $w^T x + b = +1$
Predict class $-1$ $w^T x + b = 0$

$w^T x + b = -1$

Classify as $+1$ if $w^T x + b \geq 1$
Classify as $-1$ if $w^T x + b \leq -1$
Undefined if $-1 < w^T x + b < 1$

$M = \left| x^+ - x^- \right|$ length of $\text{vector}(x^+ - x^-)$

$\Rightarrow$ How to represent $(x^+ - x^-)$???
Review: Vector Subtraction
Maximizing the margin: observation-1

- Observation 1: the vector $w$ is orthogonal to the +1 plane
  - Why?
    - Vector $(u-v)$ shown above
    - $w^T(u-v) = w^Tu - w^Tv = (1-b) - (1-b) = 0$

Let $u$ and $v$ be two points on the +1 plane, then for the vector defined by $u$ and $v$ we have $w^T(u-v) = 0$

Corollary: the vector $w$ is orthogonal to the -1 plane
The gradient points in the direction of the greatest rate of increase of the function and its magnitude is the slope of the graph in that direction.
Observation 1

Review: Orthogonal

Inner Product:
\[ W^T (u - v) = 0 \]

\[
\begin{pmatrix}
-2 & 1 \\
1 & 2 \\
\end{pmatrix}
\begin{pmatrix}
1 \\
2 \\
\end{pmatrix}
= 0
\]
Maximizing the margin: observation-1

- **Observation 1:** the vector $w$ is orthogonal to the $+1$ plane.

Mathematical expressions:

1. $w^T x + b = 1$
2. $w^T x + b = -1$
3. $w^T x + b = 0$
Maximizing the margin:
observation-2

Predict class +1

Predict class -1

Classify as +1 if \( w^T x + b \geq 1 \)
Classify as -1 if \( w^T x + b \leq -1 \)
Undefined if \(-1 < w^T x + b < 1\)

• Observation 1: the vector \( w \) is orthogonal to the +1 and -1 planes

• Observation 2: if \( x^+ \) is a point on the +1 plane and \( x^- \) is the closest point to \( x^+ \) on the -1 plane then

\[
x^+ = \lambda w + x^-
\]

Since \( w \) is orthogonal to both planes we need to ‘travel’ some distance along \( w \) to get from \( x^+ \) to \( x^- \)
Putting it together

• \( w^T x^+ + b = +1 \)
• \( w^T x^- + b = -1 \)
• \( x^+ = \lambda w + x^- \)
• \( | x^+ - x^- | = M \)

We can now define \( M \) in terms of \( w \) and \( b \):

\[
M = |x^+ - x^-| = |\lambda w| = \lambda |w| = \lambda \sqrt{w^T w} = \frac{2}{w^T w} \sqrt{w^T w} = \frac{2}{\sqrt{w^T w}}
\]
\[ w^T x^t + b = 1 \]
\[ w^T (\lambda w + x^-) + b = +1 \]

\[ \lambda w^T w + w^T x^- + b = 1 \]

\[ \lambda w^T w = 2 \]

\[ \Rightarrow \quad \lambda = \frac{2}{w^T w} \]
Putting it together

Predict class +1

\[ w^T x + b = +1 \]

Predict class -1

\[ w^T x + b = 0 \]

\[ w^T x + b = -1 \]

\[ w^T x^+ + b = +1 \]

\[ w^T (\lambda w + x^-) + b = +1 \]

\[ w^T x^- + b + \lambda w^T w = +1 \]

\[ -1 + \lambda w^T w = +1 \]

\[ \lambda = 2/w^T w \]

We can now define M in terms of w and b

\[ | x^+ - x^- | = M \]
Putting it together

Predict class +1
\[ w^T x + b = +1 \]
Predict class -1
\[ w^T x + b = -1 \]
\[ w^T x + b = 0 \]

\[ x^+ = \lambda w + x^- \]
\[ |x^+ - x^-| = M \]
\[ \lambda = 2 / w^T w \]

We can now define M in terms of w and b

\[ M = |x^+ - x^-| \]
\[ \Rightarrow \]
\[ M = |\lambda w| = \lambda |w| = \lambda \sqrt{w^T w} \]
\[ \Rightarrow \]
\[ M = 2 \frac{\sqrt{w^T w}}{w^T w} = \frac{2}{\sqrt{w^T w}} \]

\[ \max (M) \Rightarrow \min (w^T w) \]
Finding the optimal parameters

We can now search for the optimal parameters by finding a solution that:

1. Correctly classifies all points
2. Maximizes the margin (or equivalently minimizes $w^T w$)

Several optimization methods can be used: Gradient descent, simulated annealing, EM etc.
Today

$$K(x, z) := \Phi(x)^T \Phi(z)$$

**Kernel Func** $K(x_i, x_j)$

**Margin + Hinge Loss (optional)**

**QP with Dual form**

$$w = \sum_i \alpha_i x_i y_i$$

**Dual Weights**

$$\arg\min_{w,b} \sum_{i=1}^p w_i^2 + C \sum_{i=1}^n \varepsilon_i$$

subject to $\forall x_i \in D_{train}: y_i (x_i \cdot w + b) \geq 1 - \varepsilon_i$

$$\sum \alpha_i y_i = 0, \quad \alpha_i \geq 0 \quad \forall i$$

$\sum \alpha_i y_i = 0, \quad \alpha_i \geq 0 \quad \forall i$
Optimization Step

i.e. learning optimal parameter for SVM

\[ \begin{align*}
    w^T x + b &= +1 \\
    w^T x + b &= 0 \\
    w^T x + b &= -1
\end{align*} \]

\[ M = \frac{2}{\sqrt{w^T w}} \]

Min \( (w^T w)/2 \)
subject to the following constraints:

For all \( x \) in class +1
\[ w^T x + b \geq 1 \quad y_i = 1 \]

For all \( x \) in class -1
\[ w^T x + b \leq -1 \quad y_i = -1 \]

1. Correctly classifies all points
2. Maximizes the margin (or equivalently minimizes \( w^T w \))

\[ \implies \begin{align*}
    &\text{pos: } y_i = 1, \ w^T x_i + b \geq 1 \\
    &y_i (w^T x_i + b) \geq 1
\end{align*} \]

\[ \implies \begin{align*}
    &\text{neg: } y_i = -1, \ w^T x_i + b \leq -1 \\
    &y_i (w^T x_i + b) \geq 1
\end{align*} \]
Optimization Step
i.e. learning optimal parameter for SVM

Min \( \frac{(w^Tw)}{2} \)
subject to the following constraints:

For all \( x \) in class + 1
\[ w^T x + b \geq 1 \]

For all \( x \) in class - 1
\[ w^T x + b \leq -1 \]

A total of \( n \) constraints if we have \( n \) input samples

\[ M = \frac{2}{\sqrt{w^T w}} \]
Optimization Review:
Ingredients

- Objective function
- Variables
- Constraints

Find values of the variables that minimize or maximize the objective function while satisfying the constraints
Optimization with Quadratic programming (QP)

Quadratic programming solves optimization problems of the following form:

$$\min_U \frac{1}{2} u^T R u + d^T u + c$$

subject to n inequality constraints:

$$a_{11} u_1 + a_{12} u_2 + \ldots \leq b_1$$

$$\vdots \quad \vdots \quad \vdots$$

$$a_{n1} u_1 + a_{n2} u_2 + \ldots \leq b_n$$

and k equivalency constraints:

$$a_{n+1,1} u_1 + a_{n+1,2} u_2 + \ldots = b_{n+1}$$

$$\vdots \quad \vdots \quad \vdots$$

$$a_{n+k,1} u_1 + a_{n+k,2} u_2 + \ldots = b_{n+k}$$

When a problem can be specified as a QP problem we can use solvers that are better than gradient descent or simulated annealing.
SVM as a QP problem

\[
\min_U \frac{u^T Ru}{2} + d^T u + c
\]

subject to n inequality constraints:

\[
a_{11}u_1 + a_{12}u_2 + ... \leq b_1
\]

\[
\vdots \quad \vdots \quad \vdots
\]

\[
a_{n1}u_1 + a_{n2}u_2 + ... \leq b_n
\]

and k equivalency constraints:

\[
a_{n+1,1}u_1 + a_{n+1,2}u_2 + ... = b_{n+1}
\]

\[
\vdots \quad \vdots \quad \vdots
\]

\[
a_{n+k,1}u_1 + a_{n+k,2}u_2 + ... = b_{n+k}
\]

Min \((w^T w)/2\)

subject to the following inequality constraints:

For all \(x\) in class \(+1\)

\(w^T x + b \geq 1\)

For all \(x\) in class \(-1\)

\(w^T x + b \leq -1\)

A total of \(n\) constraints if we have \(n\) input samples

  - Optimization to learn model parameters \((w, b)\)
  - Linearly Non-separable case
  - Optimization with dual form
  - Nonlinear decision boundary
  - Practical Guide
Linearly Non separable case

• So far we assumed that a linear plane can perfectly separate the points

• But this is not usually the case
  - noise, outliers

How can we convert this to a QP problem?
- Minimize training errors?
  \[
  \begin{align*}
  \text{min } w^T w \\
  \text{min } \#\text{errors}
  \end{align*}
  \]
Linearly Non separable case

- So far we assumed that a linear plane can perfectly separate the points
- But this is not usually the case
  - noise, outliers

How can we convert this to a QP problem?

- Minimize training errors?
  \[ \min w^T w \]
  \[ \min \text{ #errors} \]
- Penalize training errors:
  \[ \min w^T w + C*(\text{#errors}) \]

Hard to solve (two minimization problems)

Hard to encode in a QP problem
Linearly Non separable case

• Instead of minimizing the number of misclassified points we can minimize the distance between these points and their correct plane.

The new optimization problem is:

$$\min_w \frac{w^T w}{2} + \sum_{i=1}^{n} C \varepsilon_i$$
Linearly Non separable case

- Instead of minimizing the number of misclassified points we can minimize the distance between these points and their correct plane.

The new optimization problem is:

\[
\min_w \frac{w^T w}{2} + \sum_{i=1}^{n} C\varepsilon_i
\]

subject to the following inequality constraints:

For all \( x_i \) in class + 1

\[ w^T x_i + b \geq 1 - \varepsilon_i \]

For all \( x_i \) in class - 1

\[ w^T x_i + b \leq -1 + \varepsilon_i \]

Wait. Are we missing something?
Final optimization for linearly non-separable case

The new optimization problem is:

$$\min_w \frac{w^T w}{2} + \sum_{i=1}^{n} C \varepsilon_i$$

subject to the following inequality constraints:

For all $x_i$ in class +1

$$w^T x_i + b \geq 1 - \varepsilon_i$$

For all $x_i$ in class -1

$$w^T x_i + b \leq -1 + \varepsilon_i$$

For all $i$

$$\varepsilon_i \geq 0$$
Final optimization for linearly non-separable case

The new optimization problem is:

$$\min_w \frac{w^T w}{2} + \sum_{i=1}^{n} C \varepsilon_i$$

subject to the following inequality constraints:

For all $x_i$ in class +1

$$w^T x_i + b \geq 1 - \varepsilon_i$$

For all $x_i$ in class -1

$$w^T x_i + b \leq -1 + \varepsilon_i$$

For all $i$

$$\varepsilon_i \geq 0$$
Where are we?

Two optimization problems: For the separable and non separable cases

\[ \min_w \frac{w^T w}{2} \]

For all \( x \) in class + 1

\[ w^T x + b \geq 1 \]

For all \( x \) in class - 1

\[ w^T x + b \leq -1 \]

\[ \epsilon \]

\[ \min_w \frac{w^T w}{2} + \sum_{i=1}^{n} C \epsilon_i \]

For all \( x_i \) in class + 1

\[ w^T x_i + b \geq 1 - \epsilon_i \]

For all \( x_i \) in class - 1

\[ w^T x_i + b \leq -1 + \epsilon_i \]

For all \( i \)

\[ \epsilon_i \geq 0 \]
Model Selection, find right $C$

- **Large $C$**
  - (a) Training data and an overfitting classifier
  - (b) Applying an overfitting classifier on testing data

- **Small $C$**
  - (c) Training data and a better classifier
  - (d) Applying a better classifier on testing data

Select the right penalty parameter $C$

\min_u f_0(u) = u^2 \\
\text{s.t. } \ b - u \leq 0
\end{cases}
\end{align*}
\]

\(2 \quad L(u, \alpha) = u^2 + \frac{\alpha(b-u)}{\gg0 \leq 0} \]

\(3 \quad \frac{\partial L(u, \alpha)}{\partial u} = 2u - \alpha = 0 \)

\( u = \frac{\alpha}{2} \)

\( \Rightarrow \arg\min_u L(u, \alpha) \)
\[ \begin{align*}
\min_u & \quad u^2 \\
\text{s.t.} & \quad u \geq b \\
\end{align*} \]
\[ \min_u u^2 \]
\[ \text{s.t. } u \geq b \]

\[ g(\alpha) = \mathbb{I}(u, \alpha) = \frac{\alpha^2}{4} + \alpha \left( b - \frac{\alpha}{2} \right) \]

\[ f(u) \]
\[ u = \frac{\alpha}{2} \]

\[ g(\alpha) = -\frac{\alpha^2}{4} + b \alpha \]
\[
\begin{align*}
\text{min}_u & \quad u^2 \\
\text{s.t.} & \quad u \geq b \\
\end{align*}
\]

\[
g(x) = f(u) = \frac{x^2}{4} + bx - \frac{x}{2} \quad \Rightarrow \\
g(x) = -\frac{x^2}{4} + bx \\
\frac{\partial g(x)}{\partial x} = -\frac{x}{2} + b = 0, \quad x > 0
\]
\[ \begin{align*}
\min_u u^2 \\
\text{s.t. } u \geq b
\end{align*} \]

\[ g(\alpha) = \mathcal{L}(u, \alpha) = \frac{\alpha^2}{4} + \alpha \left( b - \frac{\alpha}{2} \right) \]

\[ f(u) = \alpha \frac{u}{2} \]

\[ g(\alpha) = -\frac{\alpha^2}{4} + b\alpha \]

\[ \frac{\partial g(\alpha)}{\partial \alpha} = -\frac{\alpha}{2} + b = 0, \quad \alpha \geq 0 \]

\[ \Rightarrow \begin{cases} b > 0, & \alpha = 2b, \quad g(\alpha) = b^2 \\ b < 0, & \alpha = 0, \quad g(\alpha) = 0 \end{cases} \]

\[ f(u) = \begin{cases} b^2, & u = b \\ 0, & u = 0 \end{cases} \]
Optimization Review: Lagrangian Duality

• The Primal Problem

\[
\min_w f_0(w) \\
\text{s.t. } f_i(w) \leq 0, \quad i = 1, \ldots, k
\]

Primal:

The generalized Lagrangian:

\[
L(w, \alpha) = f_0(w) + \sum_{i=1}^{k} \alpha_i f_i(w)
\]

the \( a \)'s \( (a \geq 0) \) are called the Lagrangian multipliers

Lemma:

\[
\max_{\alpha, \alpha_i \geq 0} L(w, \alpha) = \begin{cases} 
  f_0(w) & \text{if } w \text{ satisfies primal constraints} \\
  \infty & \text{o/w}
\end{cases}
\]

A re-written Primal:

\[
\min_w \max_{\alpha, \alpha_i \geq 0} L(w, \alpha)
\]
Primal: \[ \min_w \max_\alpha L(w, \alpha) \]

Dual: \[ \max_\alpha \min_w L(w, \alpha) \]

\[ \Rightarrow \max_\alpha g(\alpha) \]
\[ f(u): \begin{cases} \min u^2 \\ \text{s.t. } u \geq b \end{cases} \]

\[ g(\alpha): \begin{cases} \max -\frac{\alpha^2}{4} + b\alpha = \max \{-(\frac{\alpha}{2} - b)^2 + b^2\} \\ \text{s.t. } \alpha > 0 \end{cases} \]

\[
\begin{cases}
\text{if } b = \frac{\alpha}{2}, & u = b, \quad g = b^2 \\
\text{if } b > \frac{\alpha}{2}, & \alpha = 0, \quad g = 0 \\
\text{if } b < \frac{\alpha}{2} &
\end{cases}
\]

\[ \Rightarrow \quad \alpha (b - u) = 0 \quad \text{KKT condition} \]
$\alpha > 2b$, $g(\alpha) = b$
$\alpha = 0$, $g(\alpha) = 0$

$b > 0$
$u = b$

$b < 0$
$u = 0$

$\Rightarrow \text{Optin-Dual } = \text{Primal - Optim}$

when $\alpha(b - u) = 0$

[KKT Conditions]
Optimization Review: Lagrangian Duality, cont.

• Recall the Primal Problem:
  \[ \min_w \max_{\alpha, \alpha_i \geq 0} L(w, \alpha) \]

• The Dual Problem:
  \[ \max_{\alpha, \alpha_i \geq 0} \min_w L(w, \alpha) \]

• Theorem (weak duality):
  \[ d^* = \max_{\alpha, \alpha_i \geq 0} \min_w L(w, \alpha) \leq \min_w \max_{\alpha, \alpha_i \geq 0} L(w, \alpha) = p^* \]

• Theorem (strong duality):
  Iff there exist a saddle point of \( L(w, \alpha) \)
  we have
  \[ d^* = p^* \]
An alternative representation of the SVM QP

- We will start with the linearly separable case
- Instead of encoding the correct classification rule and constraint we will use Lagrange multiplies to encode it as part of the our minimization problem

Recall that Lagrange multipliers can be applied to turn the following problem:

\[ L_{\text{primal}} = \frac{1}{2} \|w\|^2 - \sum_{i=1}^{N} \alpha_i \left( y_i (w \cdot x_i + b) - 1 \right) \]

\[ \text{Min} \ (w^T w)/2 \]

\text{s.t.}

\( (w^T x_i + b) y_i \geq 1 \)
An alternative representation of the SVM QP

- We will start with the linearly separable case
- Instead of encoding the correct classification rule and constraint we will use Lagrange multiplies to encode it as part of our minimization problem

Recall that Lagrange multipliers can be applied to turn the following problem:

$$L_{primal} = \frac{1}{2}||w||^2 - \sum_{i=1}^{n} \alpha_i \left(y_i (w \cdot x_i + b) - 1\right)$$

$$\text{Min } (w^T w)/2$$

s.t.

$$\sum_{i=1}^{n} \alpha_i y_i (w^T x_i + b) = 0$$

$$\alpha_i \geq 0$$

$$\sum_{i=1}^{n} \alpha_i y_i = 0$$

$$b \geq 0$$
\[
\min_{w,b} \max_\alpha \left( \frac{w^T w}{2} - \sum_i \alpha_i [(w^T x_i + b) y_i - 1] \right)
\]

\[\alpha_i \geq 0 \quad \forall i\]

\[\frac{\partial L}{\partial w} = 0 \Rightarrow w - \sum_i \alpha_i x_i y_i = 0\]
\[
\min_{w,b} \max_\alpha \left\{ \frac{w^T w}{2} - \sum_i \alpha_i [(w^T x_i + b) y_i - 1] \right\} \Rightarrow \max_\alpha \min_{w,b} L(w,b,\alpha)
\]

\[
\alpha_i \geq 0 \quad \forall i
\]

\[
\begin{align*}
\frac{\partial L}{\partial w} &= 0 \Rightarrow w - \sum_i \alpha_i x_i y_i = 0 \\
\frac{\partial L}{\partial b} &= 0 \Rightarrow \sum \alpha_i y_i = 0
\end{align*}
\]
The Dual Problem

\[
\max_{\alpha_i \geq 0} \min_{w, b} \mathcal{L}(w, b, \alpha)
\]

**Dual formulation**

- We minimize \( \mathcal{L} \) with respect to \( w \) and \( b \) first:

\[
\nabla_w \mathcal{L}(w, b, \alpha) = w - \sum_{i=1}^{\text{train}} \alpha_i y_i x_i = 0,
\]

\((*)\)

\[
\nabla_b \mathcal{L}(w, b, \alpha) = \sum_{i=1}^{\text{train}} \alpha_i y_i = 0,
\]

\((***)\)

Note that \((*)\) implies: \( w = \sum_{i=1}^{\text{train}} \alpha_i y_i x_i \)

\((****)\)

- Plus \((****)\) back to \( \mathcal{L} \), and using \((***)\), we have:

\[
\mathcal{L}(w, b, \alpha) = \sum_{i=1}^{\text{train}} \alpha_i - \frac{1}{2} \sum_{i,j=1}^{\text{train}} \alpha_i \alpha_j y_i y_j (x_i^T x_j)
\]
\[ L_{\text{primal}} = \frac{1}{2} \| \mathbf{w} \|^2 - \sum_{i=1}^{N} \alpha_i \left( y_i (\mathbf{w} \cdot \mathbf{x}_i + b) - 1 \right) \]

\[ L_{\text{dual}} = \frac{1}{2} \left( \sum \alpha_i \mathbf{x}_i \mathbf{y}_i \right)^T \left( \sum \alpha_j \mathbf{x}_j \mathbf{y}_j \right) - \sum \alpha_i \mathbf{y}_i b + \sum \alpha_i \mathbf{y}_i \mathbf{b} + \sum \alpha_i \mathbf{y}_i \mathbf{b} \]

\[ = \sum \alpha_i - \frac{1}{2} \sum \sum \alpha_i \alpha_j \mathbf{y}_i \mathbf{y}_j (\mathbf{x}_i \mathbf{x}_j) \]
Summary: Dual for SVM

Solving for \( \mathbf{w} \) that gives maximum margin:

1. Combine objective function and constraints into new objective function, using Lagrange multipliers \( \alpha_i \)

\[
L_{\text{primal}} = \frac{1}{2} \| \mathbf{w} \|^2 - \sum_{i=1}^{N} \alpha_i \left( y_i (\mathbf{w} \cdot \mathbf{x}_i + b) - 1 \right)
\]

2. To minimize this Lagrangian, we take derivatives of \( \mathbf{w} \) and \( b \) and set them to 0:
Summary: Dual for SVM

3. Substituting and rearranging gives the dual of the Lagrangian:

\[
L_{\text{dual}} = \sum_{i=1}^{N} \alpha_i - \frac{1}{2} \sum_{i} \sum_{j} \alpha_i \alpha_j y_i y_j x_i \cdot x_j
\]

which we try to maximize (not minimize).

4. Once we have the \( \alpha_i \), we can substitute into previous equations to get \( \mathbf{w} \) and \( b \).

5. This defines \( \mathbf{w} \) and \( b \) as linear combinations of the training data.

\[
\mathbf{w} = \sum_{i=1}^{\text{train}} \alpha_i y_i \mathbf{x}_i
\]
Substituting \( w \) into our target function and using the additional constraint we get:

\[
\sum_{i=1}^{n} \alpha_i y_i = 0
\]

\[
\alpha_i \geq 0 \quad \forall i
\]

Dual formulation

Easier than original QP, more efficient algorithms exist to find \( a_i \)

Min \( (w^T w)/2 \)
subject to the following inequality constraints:

For all \( x \) in class + 1

\( w^T x + b \geq 1 \)

For all \( x \) in class - 1

\( w^T x + b \leq -1 \)

A total of \( n \) constraints if we have \( n \) input samples
Optimization Review: Dual Problem

- Solving dual problem if the dual form is easier than primal form
- Need to change primal minimization to dual maximization (OR \(\Rightarrow\) Need to change primal maximization to dual minimization)
- Only valid when the original optimization problem is convex/concave (strong duality)
Optimization Review: Lagrangian (even more general standard form)

standard form problem (not necessarily convex)

\[
\begin{aligned}
\text{minimize} & \quad f_0(x) \\
\text{subject to} & \quad f_i(x) \leq 0, \quad i = 1, \ldots, m \\
& \quad h_i(x) = 0, \quad i = 1, \ldots, p
\end{aligned}
\]

variable \( x \in \mathbb{R}^n \), domain \( D \), optimal value \( p^* \)

Lagrangian: \( L : \mathbb{R}^n \times \mathbb{R}^m \times \mathbb{R}^p \rightarrow \mathbb{R} \), with \( \text{dom} L = D \times \mathbb{R}^m \times \mathbb{R}^p \),

\[
L(x, \lambda, \nu) = f_0(x) + \sum_{i=1}^{m} \lambda_i f_i(x) + \sum_{i=1}^{p} \nu_i h_i(x)
\]

- weighted sum of objective and constraint functions
- \( \lambda_i \) is Lagrange multiplier associated with \( f_i(x) \leq 0 \)
- \( \nu_i \) is Lagrange multiplier associated with \( h_i(x) = 0 \)

From Stanford “Convex Optimization — Boyd & Vandenberghe
Optimization Review: Lagrange dual function

Lagrange dual function: \( g : \mathbb{R}^m \times \mathbb{R}^p \rightarrow \mathbb{R} \),

\[
g(\lambda, \nu) = \inf_{x \in \mathcal{D}} L(x, \lambda, \nu) = \inf_{x \in \mathcal{D}} \left( f_0(x) + \sum_{i=1}^{m} \lambda_i f_i(x) + \sum_{i=1}^{p} \nu_i h_i(x) \right)
\]

\( g \) is concave, can be \(-\infty\) for some \( \lambda, \nu \)

lower bound property: if \( \lambda \geq 0 \), then \( g(\lambda, \nu) \leq p^* \)

proof: if \( \tilde{x} \) is feasible and \( \lambda \geq 0 \), then

\[
f_0(\tilde{x}) \geq L(\tilde{x}, \lambda, \nu) \geq \inf_{x \in \mathcal{D}} L(x, \lambda, \nu) = g(\lambda, \nu)
\]

minimizing over all feasible \( \tilde{x} \) gives \( p^* \geq g(\lambda, \nu) \)
Optimization Review:

**Complementary slackness**

Assume strong duality holds, \( x^* \) is primal optimal, \((\lambda^*, \nu^*)\) is dual optimal

\[
\inf (.) \text{: greatest lower bound}
\]

\[
f_0(x^*) = g(\lambda^*, \nu^*) = \inf_x \left( f_0(x) + \sum_{i=1}^m \lambda_i^* f_i(x) + \sum_{i=1}^p \nu_i^* h_i(x) \right)
\]

\[
\leq f_0(x^*) + \sum_{i=1}^m \lambda_i^* f_i(x^*) + \sum_{i=1}^p \nu_i^* h_i(x^*)
\]

\[
\leq f_0(x^*)
\]

Hence, the two inequalities hold with equality

- \( x^* \) minimizes \( L(x, \lambda^*, \nu^*) \)
- \( \lambda_i^* f_i(x^*) = 0 \) for \( i = 1, \ldots, m \) (known as complementary slackness):
  - \( \lambda_i^* > 0 \) \( \implies \) \( f_i(x^*) = 0 \)
  - \( f_i(x^*) < 0 \) \( \implies \) \( \lambda_i^* = 0 \)
Optimization Review:

Karush-Kuhn-Tucker (KKT) conditions

the following four conditions are called KKT conditions (for a problem with differentiable $f_i$, $h_i$):

1. primal constraints: $f_i(x) \leq 0$, $i = 1, \ldots, m$, $h_i(x) = 0$, $i = 1, \ldots, p$
2. dual constraints: $\lambda \succeq 0$
3. complementary slackness: $\lambda_i f_i(x) = 0$, $i = 1, \ldots, m$
4. gradient of Lagrangian with respect to $x$ vanishes:

$$\nabla f_0(x) + \sum_{i=1}^{m} \lambda_i \nabla f_i(x) + \sum_{i=1}^{p} \nu_i \nabla h_i(x) = 0$$

for page 17: if strong duality holds and $x$, $\lambda$, $\nu$ are optimal, then they must satisfy the KKT conditions.
NOT EXTRA
KKT Condition for Strong Duality

\[
\begin{align*}
\text{minimize} & \quad \left\{ f_0(x) \right\} \\
\text{subject to} & \quad \left\{ f_i(x) \leq 0, \quad i = 1, \ldots, m \right\} \\
& \quad h_i(x) = 0, \quad i = 1, \ldots, p
\end{align*}
\]

Lagrangian: \( L : \mathbb{R}^n \times \mathbb{R}^m \times \mathbb{R}^p \to \mathbb{R} \), with \( \text{dom} \ L = D \times \mathbb{R}^m \times \mathbb{R}^p \),

\[
L(x, \lambda, \nu) = f_0(x) + \sum_{i=1}^{m} \lambda_i f_i(x) + \sum_{i=1}^{p} \nu_i h_i(x)
\]

complementary slackness: \( \lambda_i f_i(x) = 0, \ i = 1, \ldots, m \)
KKT \implies \text{Support vectors}

- Note the KKT condition --- only a few \(a_i\)'s can be nonzero!!

\[
\alpha_i \left( y_i (\mathbf{w}^T \mathbf{x}_i + b) - 1 \right) = 0, \quad i = 1, \ldots, n
\]

Call the training data points whose \(a_i\)'s are nonzero the support vectors (SV)
\[ \alpha_i \left( y_i (\mathbf{w} \cdot \mathbf{x}_i + b) - 1 \right) = 0, \quad i = 1, \ldots, n \]

Most $\alpha_i = 0$
Dual SVM for linearly separable case – Training

Our dual target function:

\[
\max_{\alpha} \sum_i \alpha_i - \frac{1}{2} \sum_{i,j} \alpha_i \alpha_j y_i y_j x_i^T x_j
\]

\[
\sum_i \alpha_i y_i = 0
\]

\[
\alpha_i \geq 0 \quad \forall i
\]

Dot product for all training samples

\[
\sum_{i=1}^{n} \sum_{j=1}^{n} x_i^T x_j
\]

Matrix

\[
\begin{pmatrix}
1 & 2 & \ldots & i & \ldots & n \\
2 & 3 & \ldots & i & \ldots & n \\
& & \ddots & \ldots & \ddots & \ldots \\
1 & 2 & \ldots & i & \ldots & n \\
\end{pmatrix}
\]

n x n
Dual SVM for linearly separable case – Testing

To evaluate a new sample $x_{ts}$ we need to compute:

$$w^T x_{ts} + b = \sum_{i=1}^{n} \alpha_i y_i x_i^T x_{ts} + b$$

Dot product with ("all" ??) training samples

$$y_{ts} = \text{Sign} (w^T x + b)$$
Dual SVM - interpretation

\[
\mathbf{w} = \sum \alpha_i \mathbf{x}_i y_i
\]

For \( \alpha_i \) that are 0, no influence
**Dual formulation for linearly non-separable case**

**Dual target function:**

\[
\max_{\alpha} \sum_i \alpha_i - \frac{1}{2} \sum_{ij} \alpha_i \alpha_j y_i y_j x_i^T x_j \\
\sum_i \alpha_i y_i = 0 \\
C > \alpha_i \geq 0, \forall i
\]

The only difference is that the \(\alpha\) are now bounded.

Hyperparameter \(C\) should be tuned through k-folds CV.

This is very similar to the optimization problem in the linear separable case, except that there is an upper bound \(C\) on \(a_i\) now.

Once again, efficient algorithm exist to find \(a_i\).
Dual formulation for linearly non-separable case

Dual target function:

\[
\max_{\alpha} \sum_i \alpha_i - \frac{1}{2} \sum_{ij} \alpha_i \alpha_j y_i y_j x_i^T x_j
\]

\[
\sum_i \alpha_i y_i = 0
\]

\[C > \alpha_i \geq 0, \forall i\]

Hyperparameter \(C\) should be tuned through k-folds CV

The only difference is that the \(\alpha\) are now bounded

To evaluate a new sample \(x\), we need to compute:

\[
w^T x + b = \sum_{i=1}^{n} \alpha_i y_i x_i^T x + b
\]

This is very similar to the optimization problem in the linear separable case, except that there is an upper bound \(C\) on \(a_i\) now

Once again, efficient algorithm exist to find \(a_i\)
EXTRA
Dual formulation for linearly non-separable case

Substituting (1), (2), and (3) into the Lagrange, we have:

\[ L(\alpha) = \sum_{i=1}^{N} \alpha_i - \frac{1}{2} \sum_{i=1}^{N} \sum_{k=1}^{N} \alpha_i \alpha_k y_i y_k x_i^T x_k, \] 
with \( 0 \leq \alpha_i \leq C \) and \( \sum_{i=1}^{N} \alpha_i y_i = 0. \) (4)

- \( \hat{\alpha}_i > 0 \): which implies \( y_i (x_i^T \hat{\mathbf{w}} + \hat{b}) - 1 + \hat{\xi}_i = 0 \) according to (5). These points are the support vectors.

- \( \hat{\xi}_i = 0 \): which implies \( \hat{\mu}_i > 0 \) from (6) and so \( \hat{\alpha}_i < C \) from (3). There are the support points which lie on the edge of the margin.

- \( \hat{\xi}_i > 0 \): which implies \( \hat{\mu}_i = 0 \) from (6) and so \( \hat{\alpha}_i = C \) from (3). There are the support points which violate the margin.

- \( \hat{\alpha}_i = 0 \): These points are not support vectors, which play no role in determining the hyperplane.
Fast SVM Implementations

- SMO: Sequential Minimal Optimization
- SVM-Light
- LibSVM
- BSVM
- ....
SMO: Sequential Minimal Optimization

- Key idea
  - Divide the large QP problem of SVM into a series of smallest possible QP problems, which can be solved analytically and thus avoids using a time-consuming numerical QP in the loop (a kind of SQP method).
  - Space complexity: $O(n)$.
  - Since QP is greatly simplified, most time-consuming part of SMO is the evaluation of decision function, therefore it is very fast for linear SVM and sparse data.

$$\text{argmax}_{\alpha_1, \alpha_2, \ldots, \alpha_n} \left\{ \sum_{i=1}^{n} \alpha_i - \sum_{i=1}^{n} \sum_{j=1}^{n} \alpha_i \alpha_j y_i y_j x_i^T x_j \right\}$$

$$\alpha_i \left( y_i (w^T x_i + b) - 1 \right) = 0$$
SMO

• At each step, SMO chooses 2 Lagrange multipliers to jointly optimize, find the optimal values for these multipliers and updates the SVM to reflect the new optimal values.

• Three components
  – An analytic method to solve for the two Lagrange multipliers
  – A heuristic for choosing which (next) two multipliers to optimize
  – A method for computing $b$ at each step, so that the KTT conditions are fulfilled for both the two examples (corresponding to the two multipliers)
Choosing Which Multipliers to Optimize

• First multiplier
  – Iterate over the entire training set, and find an example that violates the KTT condition.

• Second multiplier
  – Maximize the size of step taken during joint optimization.
  – $|E_1 - E_2|$, where $E_i$ is the error on the $i$-th example.

Dual SVM for linearly separable case – Training / Testing

Our dual target function:

\[
\max_{\alpha} \sum_i \alpha_i - \frac{1}{2} \sum_{i,j} \alpha_i \alpha_j y_i y_j x_i^T x_j
\]

\[
\sum_i \alpha_i y_i = 0
\]

\[
\alpha_i \geq 0 \quad \forall i
\]

To evaluate a new sample \(x_{ts}\) we need to compute:

\[
w^T x_{ts} + b = \sum_i \alpha_i y_i x_i^T x_{ts} + b
\]

\[
\hat{y}_{ts} = \text{sign}\left( \sum_{i \in \text{SupportVectors}} \alpha_i y_i \left( x_i^T x_{ts} \right) + b \right)
\]
$$\max_{\alpha} \sum_i \alpha_i - \frac{1}{2} \sum_{i,j} \alpha_i \alpha_j y_i y_j x_i^T x_j$$

$$\sum_i \alpha_i y_i = 0$$

$$C > \alpha_i \geq 0, \forall i$$

$$\max_{\alpha} \sum_i \alpha_i - \sum_{i,j} \alpha_i \alpha_j y_i y_j \Phi(x_i)^T \Phi(x_j)$$

$$\sum_i \alpha_i y_i = 0$$

$$C > \alpha_i \geq 0, \forall i$$
\[ w^T x_{ts} + b = \sum_i \alpha_i y_i x_i^T x_{ts} + b \]

\[ \hat{y}_{ts} = \text{sign} \left( \sum_{i \in \text{SupportVectors}} \alpha_i y_i (x_i^T x_{ts}) + b \right) \]

\[ = \sum_{i} \alpha_i y_i \Phi(x_i) \Phi(x_{ts}) + b \]
Classifying in 1-d

Can an SVM correctly classify this data?

What about this?
Classifying in 1-d

Can an SVM correctly classify this data?

And now? (extend with polynomial basis)

$X^2$
RECAP: Polynomial regression

For example, $\phi(x) = [1, x, x^2]$
Non-linear SVMs: 2D

- The original input space \( (x) \) can be mapped to some higher-dimensional feature space \( (\phi(x)) \) where the training set is separable:

\[
\Phi: x \rightarrow \phi(x)
\]

\[
\phi(x) = (x_1^2, x_2^2, \sqrt{2} x_1 x_2)
\]

\[x = (x_1, x_2)\]

Separable/non-linear
Non-linear SVMs: 2D

- The original input space ($x$) can be mapped to some higher-dimensional feature space ($\phi(x)$) where the training set is separable:

$$x = (x_1, x_2)$$

$$\phi(x) = (x_1^2, x_2^2, 2x_1x_2)$$

If data is mapped into sufficiently high dimension, then samples will in general be linearly separable; N data points are in general separable in a space of N-1 dimensions or more!!!
A little bit theory:
Vapnik-Chervonenkis (VC) dimension

If data is mapped into sufficiently high dimension, then samples will in general be linearly separable;
N data points are in general separable in a space of N-1 dimensions or more!!!

- VC dimension of the set of oriented lines in $\mathbb{R}^2$ is 3
  - It can be shown that the VC dimension of the family of oriented separating hyperplanes in $\mathbb{R}^N$ is at least N+1
Transformation of Inputs

• Possible problems
  - High computation burden due to high-dimensionality
  - Many more parameters

Is this too much computational work?

If data is mapped into sufficiently high dimension, then samples will in general be linearly separable; N data points are in general separable in a space of N-1 dimensions or more!!!

  - Dual formulation only assigns parameters to samples, not features

Is this too much computational work?
• SVM solves these two issues simultaneously
  – “Kernel tricks” for efficient computation
  – Dual formulation only assigns parameters to samples, not features

(1). “Kernel tricks” for efficient computation

Never represent features explicitly

☐ Compute dot products in closed form

Very interesting theory – Reproducing Kernel Hilbert Spaces

☐ Not covered in detail here
$K(x_i, x_j) \equiv \phi(x_i)^T \phi(x_j)$ is called the kernel function.

- Linear kernel (we've seen it) $K(x, z) = x^T z$

- Polynomial kernel (we just saw an example)

$$K(x, z) = (1 + x^T z)^d = \phi_p(x)^T \phi_p(z)$$

where $p = 2, 3, \ldots$ To get the feature vectors we concatenate all $p$th order polynomial terms of the components of $x$ (weighted appropriately).

- Radial basis kernel

$$K(x, z) = \exp\left(-r\|x - z\|^2 \right) = \phi_r(x)^T \phi_r(z)$$

In this case, $r$ is hyperpara. The feature space of the RBF kernel has an infinite number of dimensions.

- Never represent features explicitly
- Compute dot products in closed form
- Very interesting theory – Reproducing Kernel Hilbert Spaces
- Not covered in detail here
Kernel Trick: Quadratic kernels

• While working in higher dimensions is beneficial, it also increases our running time because of the dot product computation.

• However, there is a neat trick we can use.

• Consider all quadratic terms for $x_1, x_2 \ldots x_m$.

Weights on quadratic terms will become clear in the next slide.

$m+1$ linear terms

$m$ quadratic terms

$m(m-1)/2$ pairwise terms

$K(x, z) := \Phi(x)^T \Phi(z)$

$max_{\alpha} \sum_i \alpha_i - \sum_{i,j} \alpha_i \alpha_j y_i y_j \Phi(x_i)^T \Phi(x_j)$

$\sum_i \alpha_i y_i = 0$

$\alpha_i \geq 0 \quad \forall i$

While working in higher dimensions is beneficial, it also increases our running time because of the dot product computation.
Dot product for quadratic kernels

How many operations do we need for the dot product?

\[ \Phi(x)^T \Phi(z) = \]

\[ = \sum_{i} 2x_i z_i + \sum_{i} x_i^2 z_i^2 + \sum_{j=i+1} \sum_{i} 2x_i x_j z_i z_j + 1 \]

\[ \approx m^2 \]

\[ K(x, z) := \Phi(x)^T \Phi(z) \]
\[ K(x, z) = \left(1 + x^T z\right)^2 \]

\[ k(x, \zeta) = \left(1 + x_1 \zeta_1 + x_2 \zeta_2\right)^2 \]

\[ \Rightarrow O(P) \]

\[ O(P^2) \]

\[ = \begin{pmatrix} 1, \sqrt{2} x_1, \sqrt{2} x_2, x_1^2, x_2^2, x_1 x_2 \end{pmatrix}^T \]

\[ = \Phi^T (x) \Phi(\zeta) \]

In the previous page, we use \( M \) as \( \Phi \) features. Normally we use \( P \).
The kernel trick

How many operations do we need for the dot product?

$$\Phi(x)^T \Phi(z) = \sum_i 2x_i z_i + \sum_i x_i^2 z_i^2 + \sum_i \sum_{j=i+1} 2x_i x_j z_i z_j + 1$$

$$\approx m^2$$

However, we can obtain dramatic savings by noting that

$$\Phi(x)^T \Phi(z) = (x^T z + 1)^2 = (x.z + 1)^2$$

$$= (x.z)^2 + 2(x.z) + 1$$

$$= (\sum_i x_i z_i)^2 + \sum_i 2x_i z_i + 1$$

$$= \sum_i 2x_i z_i + \sum_i x_i^2 z_i^2 + \sum_i \sum_{j=i+1} 2x_i x_j z_i z_j + 1$$

We only need m operations!

So, if we define the kernel function as follows, there is no need to carry out basis function $\Phi(x)$ explicitly

$$K(x, z) = (x^T z + 1)^2$$
Kernel Trick

Our dual target function:

$$\max_{\alpha} \sum_{i} \alpha_i - \frac{1}{2} \sum_{i,j} \alpha_i \alpha_j y_i y_j \Phi(x_i)^T \Phi(x_j)$$

$$\sum_{i} \alpha_i y_i = 0$$

$$\alpha_i \geq 0 \quad \forall i$$

$$mn^2$$ operations at each iteration

To evaluate a new sample $$x_k$$ we need to compute:

$$w^T \Phi(x_k) + b = \sum_{i} \alpha_i y_i \Phi(x_i)^T \Phi(x_k) + b$$

$$O(mn^2)$$

$$mr$$ operations where $$r$$ are the number of support vectors (whose $$\alpha_i > 0$$)

$$K(x, z) = (x^T z + 1)^2$$
Summary: Modification Due to Kernel Trick

- Change all inner products to kernel functions
- For training,

Original Linear

\[ \max_{\alpha} \sum_i \alpha_i - \frac{1}{2} \sum_{i,j} \alpha_i \alpha_j y_i y_j x_i^T x_j \]
\[ \sum_i \alpha_i y_i = 0 \]
\[ C > \alpha_i \geq 0, \forall i \in \text{train} \]

With kernel function - nonlinear

\[ \max_{\alpha} \sum_i \alpha_i - \frac{1}{2} \sum_{i,j} \alpha_i \alpha_j y_i y_j K(x_i, x_j) \]
\[ \sum_i \alpha_i y_i = 0 \]
\[ C > \alpha_i \geq 0, \forall i \in \text{train} \]
Summary:
Modification Due to Kernel Function

- For testing, the new data \( x_{ts} \)

Original Linear
\[
\hat{y}_{ts} = \text{sign} \left( \sum_{i \in \text{train}} \alpha_i y_i x_i^T x_{ts} + b \right)
\]

With kernel function - nonlinear
\[
\hat{y}_{ts} = \text{sign} \left( \sum_{i \in \text{train}} \alpha_i y_i K(x_i, x_{ts}) + b \right)
\]
An example: Support vector machines with polynomial kernel

Figure 5.29. Decision boundary produced by a nonlinear SVM with polynomial kernel.
Kernel Trick: Implicit Basis Representation

- For some kernels (e.g. RBF) the implicit transform basis form \( \phi(x) \) is infinite-dimensional!
  - But calculations with kernel are done in original space, so computational burden and curse of dimensionality aren’t a problem.

\[
K(x,z) = \exp\left(-r\|x - z\|^2\right)
\]

Gaussian RBF Kernel corresponds to an infinite-dimensional vector space.

YouTube video of Caltech: Abu-Mostafa explaining this in more detail

https://www.youtube.com/watch?v=XUj5JbQihlU&t=25m53s
Kernel Functions

• In practical use of SVM, only the kernel function (and not \( \Phi(x) \)) is specified.

• Kernel function can be thought of as a similarity measure between the input objects.

• Not all similarity measure can be used as kernel function, however Mercer's condition states that any positive semi-definite kernel \( K(x, y) \), i.e.

\[
\sum_{i,j} K(x_i, x_j) c_i c_j \geq 0
\]

...can be expressed as a dot product in a high dimensional space.
Choosing the Kernel Function

- Probably the most tricky part of using SVM.

- The kernel function is important because it creates the kernel matrix, which summarize all the data

- Many principles have been proposed (diffusion kernel, Fisher kernel, string kernel, tree kernel, graph kernel, ...)
  - Kernel trick has helped Non-traditional data like strings and trees able to be used as input to SVM, instead of feature vectors

- In practice, a low degree polynomial kernel or RBF kernel with a reasonable width is a good initial try for most applications.
Kernel Matrix

- The kernel function is important because it creates the kernel matrix, which summarizes all the data.
Kernel trick has helped non-traditional data like strings and trees able to be used as input to SVM, instead of feature vectors.
Mercer Kernel vs. Smoothing Kernel

• The Kernels used in Support Vector Machines are different from the Kernels used in LocalWeighted /Kernel Regression.

• We can think
  – Support Vector Machines’ kernels as Mercer Kernels
  – Local Weighted / Kernel Regression’s kernels as Smoothing Kernels
Why do SVMs work?

- If we are using huge features spaces (e.g., with kernels), how come we are not overfitting the data?
  - Number of parameters remains the same (and most are set to 0)
  - While we have a lot of input values, at the end we only care about the support vectors and these are usually a small group of samples
  - The minimization (or the maximizing of the margin) function acts as a sort of regularization term leading to reduced overfitting
Why SVM Works?

- Vapnik argues that the fundamental problem is not the number of parameters to be estimated. Rather, the problem is about the flexibility of a classifier.

- Vapnik argues that the flexibility of a classifier should not be characterized by the number of parameters, but by the capacity of a classifier.
  - This is formalized by the "VC-dimension" of a classifier.

- The SVM objective can also be justified by structural risk minimization: the empirical risk (training error), plus a term related to the generalization ability of the classifier, is minimized.

- Another view: the SVM loss function is analogous to ridge regression. The term $\frac{1}{2}||w||^2$ "shrinks" the parameters towards zero to avoid overfitting.
Today

Software

• A list of SVM implementation can be found at
  – http://www.kernel-machines.org/software.html

• Some implementation (such as LIBSVM) can handle multi-class classification
• SVMLight is among one of the earliest implementation of SVM
• Several Matlab toolboxes for SVM are also available
Summary: Steps for Using SVM in HW

- Prepare the feature-data matrix
- Select the kernel function to use
- Select the parameter of the kernel function and the value of $C$
  - You can use the values suggested by the SVM software, or you can set apart a validation set to determine the values of the parameter
- Execute the training algorithm and obtain the $\alpha_i$
- Unseen data can be classified using the $\alpha_i$ and the support vectors
Practical Guide to SVM

• From authors of as LIBSVM:
  – A Practical Guide to Support Vector Classification
    Chih-Wei Hsu, Chih-Chung Chang, and Chih-Jen Lin, 2003-2010
LIBSVM

  - Developed by Chih-Jen Lin etc.
  - Tools for Support Vector classification
  - Also support multi-class classification
  - C++/Java/Python/Matlab/Perl wrappers
  - Linux/UNIX/Windows
  - SMO implementation, fast!!!

  ...

- Testing.dat
(b) Feature Preprocessing

• (1) Categorical Feature
  – Recommend using \( m \) numbers to represent an \( m \)-category attribute.
  – Only one of the \( m \) numbers is one, and others are zero.
  – For example, a three-category attribute such as \{red, green, blue\} can be represented as \( (0,0,1) \), \( (0,1,0) \), and \( (1,0,0) \)
Feature Preprocessing

• (2) Scaling before applying SVM is very important

  – to avoid attributes in greater numeric ranges dominating those in smaller numeric ranges.
  – to avoid numerical difficulties during the calculation
  – Recommend linearly scaling each attribute to the range $[1, +1]$ or $[0, 1]$.

\[
\begin{align*}
\text{Normalization} & \rightarrow \frac{\text{mean}}{\text{std}} + 1 \\
\text{Scaling} & \rightarrow \text{linear} \Rightarrow [ax + b]
\end{align*}
\]

E.g. \[\frac{X - X_{\text{min}}}{\text{max} - X_{\text{min}}}\]
For $i$-th feature $\Rightarrow$ (Column operation on $X_{n \times p}$)

\[
\begin{align*}
\text{Centering} : \quad X_i - \bar{X}_i \Rightarrow E(X_i) &= 0 \\
\text{Scaling} : \quad aX_i + b \Rightarrow \text{e.g.} \quad \frac{X_i - \min(X_i)}{\max(X_i) - \min(X_i)} \\
\text{Normalization} : \Rightarrow \left\{ \begin{array}{l} E(X_i) = 0 \\ \text{Var}(X_i) = 1 \end{array} \right. 
\end{align*}
\]
Of course we have to use the same method to scale both training and testing data. For example, suppose that we scaled the first attribute of training data from $[-10, +10]$ to $[-1, +1]$. If the first attribute of testing data lies in the range $[-11, +8]$, we must scale the testing data to $[-1.1, +0.8]$. See Appendix B for some real examples.

If training and testing sets are separately scaled to $[0, 1]$, the resulting accuracy is lower than 70%.

```
$ ../svm-scale -l 0 svmguide4 > svmguide4.scale
$ ../svm-scale -l 0 svmguide4.t > svmguide4.t.scale
$ python easy.py svmguide4.scale svmguide4.t.scale
Accuracy = 69.2308% (216/312) (classification)
```

Using the same scaling factors for training and testing sets, we obtain much better accuracy.

```
$ ../svm-scale -l 0 -s range4 svmguide4 > svmguide4.scale
$ ../svm-scale -r range4 svmguide4.t > svmguide4.t.scale
$ python easy.py svmguide4.scale svmguide4.t.scale
Accuracy = 89.4231% (279/312) (classification)
```
Feature Preprocessing

• (3) missing value
  – Very very tricky!
  – **Easy way:** to substitute the missing values by the mean value of the variable
  – A little bit harder way: imputation using nearest neighbors
  – Even more complex: e.g. EM based (beyond the scope)
(c) Model Selection

Our goal: find the model $M$ which minimizes the test error:

![Graph showing the relationship between model complexity and error]
(c) Model Selection (e.g. for linear kernel)

- linear: \( K(x_i, x_j) = x_i^T x_j \).

Select the right penalty parameter \( C \).
(c) Model Selection

- radial basis function (RBF): \( K(x_i, x_j) = \exp(-\gamma \|x_i - x_j\|^2), \gamma > 0. \)
  
  Two parameters for an RBF kernel: \( C \) and \( \gamma \)

- polynomial: \( K(x_i, x_j) = (\gamma x_i^T x_j + r)^d, \gamma > 0. \)
  
  Three parameters for a polynomial kernel
(d) Pipeline Procedures

• (1) train / test
• (2) k-folds cross validation
• (3) k-CV on train to choose hyperparameter / then test
Evaluation Choice-I: Train and Test

Training dataset consists of input-output pairs

Evaluation

Measure Loss on pair \((f(x_o), y_o)\)
Evaluation Choice-II: Cross Validation

- Problem: don’t have enough data to set aside a test set
- Solution: Each data point is used both as train and test
- Common types:
  - K-fold cross-validation (e.g. K=5, K=10)
  - 2-fold cross-validation
  - Leave-one-out cross-validation (LOOCV)

A good practice is: to random shuffle all training sample before splitting
Why Maximum Margin for SVM?

- denotes +1
- denotes -1

Support Vectors are those datapoints that the margin pushes up against

1. Intuitively this feels safest.
2. If we’ve made a small error in the location of the boundary (it’s been jolted in its perpendicular direction) this gives us least chance of causing a misclassification.
3. LOOCV is easy since the model is immune to removal of any non-support-vector datapoints.
4. There’s some theory (using VC dimension) that is related to (but not the same as) the proposition that this is a good thing.
5. Empirically it works very very well.
Evaluation Choice-III:

Many beginners use the following procedure now:

- Transform data to the format of an SVM package
- Randomly try a few kernels and parameters
- Test

We propose that beginners try the following procedure first:

- Transform data to the format of an SVM package
- Conduct simple scaling on the data
- Consider the RBF kernel $K(x, y) = e^{-\gamma \|x-y\|^2}$
- Use cross-validation to find the best parameter $C$ and $\gamma$
- Use the best parameter $C$ and $\gamma$ to train the whole training set
- Test

For HW2-Q2
