

signals

Unix-like *operating system feature*

like exceptions, but for processes:

can be triggered by an external process
kill command/system call

can be triggered by special events
pressing control-C
other events that would normally terminate program
'segmentation fault'
illegal instruction
divide by zero

can invoke *signal handler* (like exception handler)

exceptions v signals

(hardware) exceptions	signals
handler runs in kernel mode	handler runs in user mode
hardware decides when	OS decides when
hardware needs to save PC	OS needs to save PC + registers
processor program counter changes	thread program counter changes
program counter = instruction to run next	

exceptions v signals

(hardware) exceptions	signals
handler runs in kernel mode	handler runs in user mode
hardware decides when	<i>OS decides when</i>
hardware needs to save PC	OS needs to save PC + registers
processor program counter changes	thread program counter changes
program counter = instruction to run next	
...but OS needs to run to trigger handler most likely “forwarding” hardware exception	

exceptions v signals

(hardware) exceptions	signals
handler runs in kernel mode	handler runs in user mode
hardware decides when	OS decides when
hardware needs to save PC	OS needs to save PC <i>+ registers</i>
processor program counter changes	thread program counter changes
program counter = instruction to run next	

signal handler follows normal calling convention
not special assembly like typical exception handler

exceptions v signals

(hardware) exceptions	signals
handler runs in kernel mode	handler runs in user mode
hardware decides when	OS decides when
hardware needs to save PC	OS needs to save PC + registers
<i>processor</i> program counter changes	<i>thread</i> program counter changes
program counter = instruction to run next	
signal handler runs in same thread ('virtual processor') as process was using before	
not running at 'same time' as the code it interrupts	

base program

```
int main() {
    char buf[1024];
    while (fgets(buf, sizeof buf, stdin)) {
        printf("read %s", buf);
    }
}
```

base program

```
int main() {
    char buf[1024];
    while (fgets(buf, sizeof buf, stdin)) {
        printf("read %s", buf);
    }
}
```

some input

read some input

more input

read more input

(control-C pressed)

(program terminates immediately)

base program

```
int main() {
    char buf[1024];
    while (fgets(buf, sizeof buf, stdin)) {
        printf("read %s", buf);
    }
}
```

some input

read some input

more input

read more input

(control-C pressed)

(program terminates immediately)

new program

```
int main() {  
    ... // added stuff shown later  
    char buf[1024];  
    while (fgets(buf, sizeof buf, stdin)) {  
        printf("read %s", buf);  
    }  
}
```

some input

read some input

more input

read more input

(control-C pressed)

Control-C pressed?!

    ... // added stuff shown later  
    char buf[1024];  
    while (fgets(buf, sizeof buf, stdin)) {  
        printf("read %s", buf);  
    }  
}
```

some input

read some input

more input

read more input

(control-C pressed)

Control-C pressed?!

another input **read another input**

example signal program

```
void handle_sigint(int signum) {
    /* signum == SIGINT */
    write(1, "Control-C\u201dpress?!\n", sizeof("Control-C\u201dpress?!\n"));
}

int main(void) {
    struct sigaction act;
    act.sa_handler = &handle_sigint;
    sigemptyset(&act.sa_mask);
    // SA_RESTART = if syscall interrupted,
    // complete it when handler returns
    act.sa_flags = SA_RESTART;
    sigaction(SIGINT, &act, NULL);

    char buf[1024];
    while (fgets(buf, sizeof buf, stdin)) {
        printf("read\u201d%s", buf);
    }
}
```

example signal program

```
void handle_sigint(int signum) {
    /* signum == SIGINT */
    write(1, "Control-C\u2014press?!\\n", sizeof("Control-C\u2014press?!\\n"));
}

int main(void) {
    struct sigaction act;
    act.sa_handler = &handle_sigint;
    sigemptyset(&act.sa_mask);
    // SA_RESTART = if syscall interrupted,
    // complete it when handler returns
    act.sa_flags = SA_RESTART;
    sigaction(SIGINT, &act, NULL);

    char buf[1024];
    while (fgets(buf, sizeof buf, stdin)) {
        printf("read\u2014%s", buf);
    }
}
```

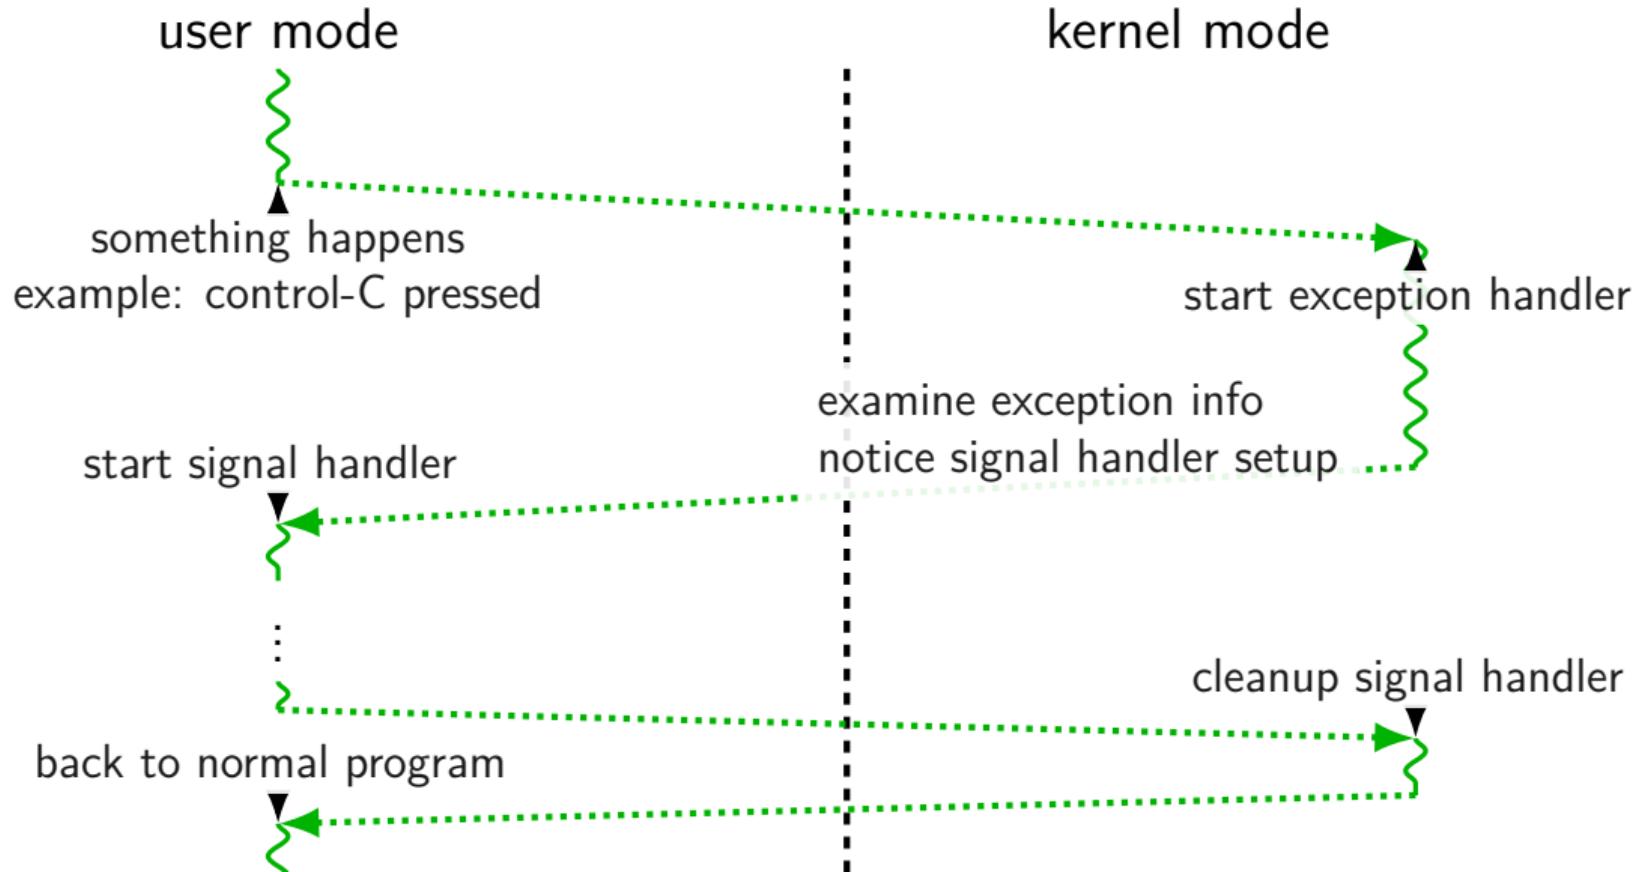

example signal program

```
void handle_sigint(int signum) {
    /* signum == SIGINT */
    write(1, "Control-C\u2014press?!\\n", sizeof("Control-C\u2014press?!\\n"));
}

int main(void) {
    struct sigaction act;
    act.sa_handler = &handle_sigint;
    sigemptyset(&act.sa_mask);
    // SA_RESTART = if syscall interrupted,
    // complete it when handler returns
    act.sa_flags = SA_RESTART;
    sigaction(SIGINT, &act, NULL);

    char buf[1024];
    while (fgets(buf, sizeof buf, stdin)) {
        printf("read\u2014%s", buf);
    }
}
```

'forwarding' exception as signal

SIGxxxx

signals types identified by number...

constants declared in <signal.h>

constant	likely use
SIGBUS	“bus error”; certain types of invalid memory accesses
SIGSEGV	“segmentation fault”; other types of invalid memory accesses
SIGINT	what control-C usually does
SIGFPE	“floating point exception”; includes integer divide-by-zero
SIGHUP, SIGPIPE	reading from/writing to disconnected terminal/socket
SIGUSR1, SIGUSR2	use for whatever you (app developer) wants
SIGKILL	terminates process (cannot be handled by process!)
SIGSTOP	suspends process (cannot be handled by process!)
...	...

    sigemptyset(&act.sa_mask);
    act.sa_flags = SA_RESTART;
    sigaction(SIGSEGV, &act, NULL);

    asm("movq %rax, 0x12345678");
}
```

```
got SIGSEGV
got SIGSEGV
got SIGSEGV
```

signal API

`sigaction` — register handler for signal

`kill` — send signal to process

uses *process ID* (integer, retrieve from `getpid()`)

`pause` — put process to sleep until signal received

`sigprocmask` — temporarily block/unblock some signals from being received

signal will still be *pending*, received if unblocked

... and much more

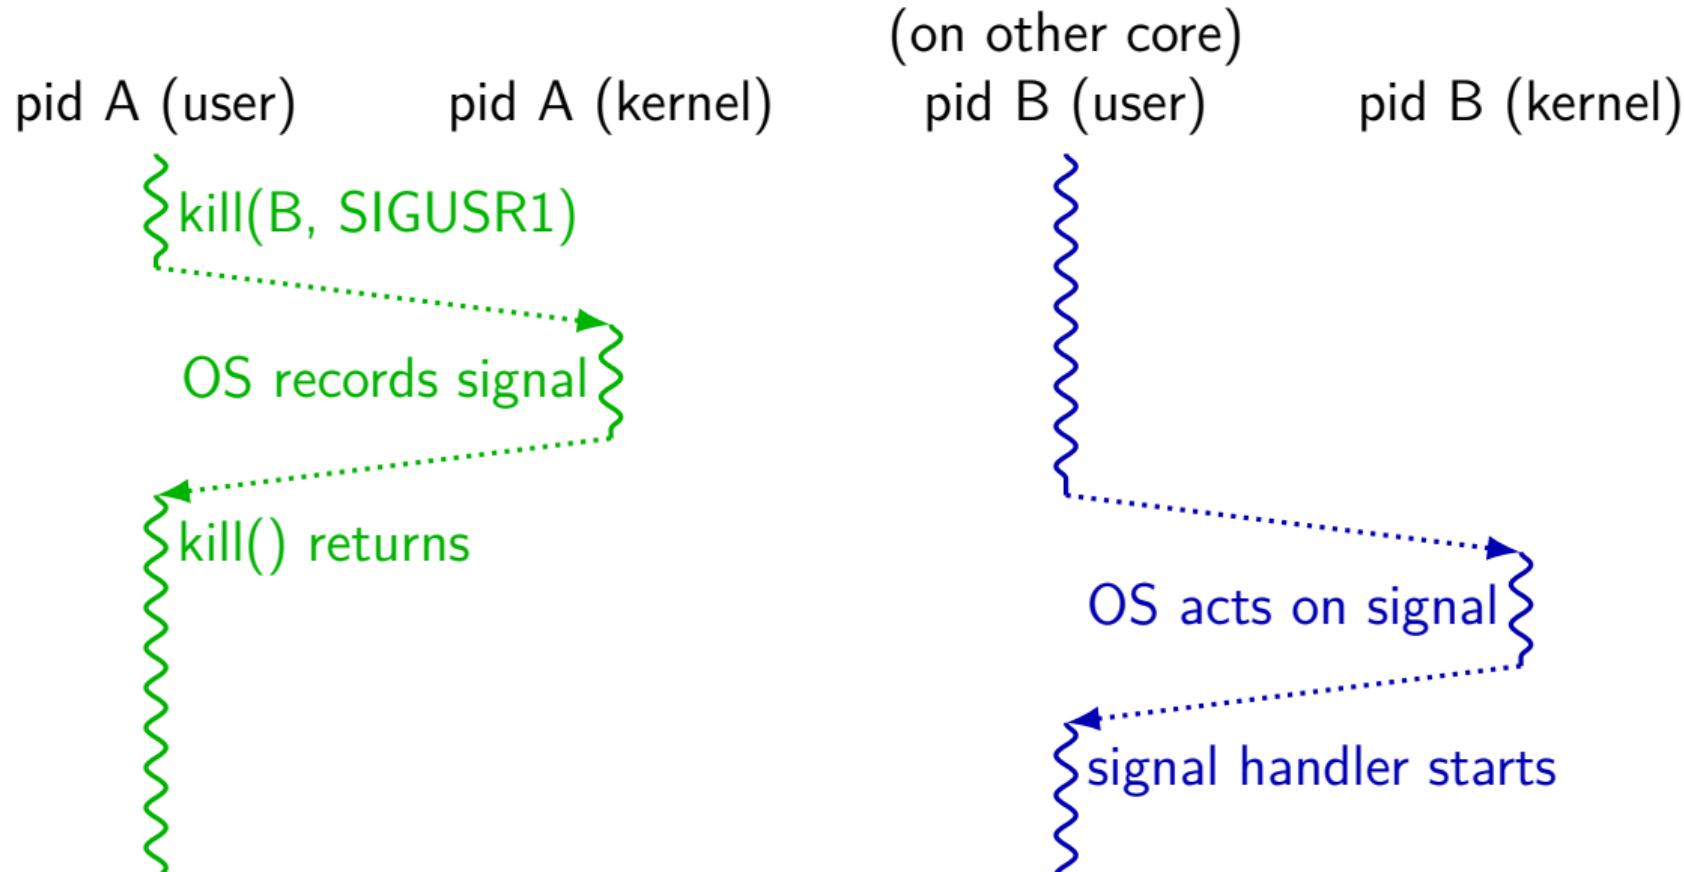

kill command

kill command-line command : calls the `kill()` function

`kill 1234` — sends SIGTERM to pid 1234
in C: `kill(1234, SIGTERM)`

`kill -USR1 1234` — sends SIGUSR1 to pid 1234
in C: `kill(1234, SIGUSR1)`

`kill()` not always immediate

output of this?

pid 1000

```
void handle_usr1(int num) {
    write(1, "X", 1);
    kill(2000, SIGUSR1);
    _exit(0);
}

int main() {
    struct sigaction act;
    ... // initialize rest of "act"
    act.sa_handler = &handle_usr1;
    sigaction(SIGUSR1, &act, NULL);
    kill(1000, SIGUSR1);
}
```

pid 2000

```
void handle_usr1(int num) {
    write(1, "Y", 1);
    _exit(0);
}

int main() {
    struct sigaction act;
    ... // initialize rest of "act"
    act.sa_handler = &handle_usr1;
    sigaction(SIGUSR1, &act, NULL);
}
```

If these run at same time, expected output?

- A. XY
- B. X
- C. Y
- D. YX
- E. X or XY, depending on timing
- F. crash
- G. (nothing)
- H. something else

output of this? (v2)

pid 1000

```
void handle_usr1(int num) {
    write(1, "X", 1);
    kill(2000, SIGUSR1);
    _exit(0);
}
int main() {
    struct sigaction act;
    ... // initialize rest of "act"
    act.sa_handler = &handle_usr1;
    sigaction(SIGUSR1, &act);
    sleep(1);
    kill(1000, SIGUSR1);
    while (1) pause();
}
```

pid 2000

```
void handle_usr1(int num) {
    write(1, "Y", 1);
    _exit(0);
}
int main() {
    struct sigaction act;
    ... // initialize rest of "act"
    act.sa_handler = &handle_usr1;
    sigaction(SIGUSR1, &act);
    while (1) pause();
}
```

If these run at same time, expected output?

- A. XY
- B. X
- C. Y
- D. YX
- E. X or XY, depending on timing
- F. crash
- G. (nothing)
- H. something else

signal handler unsafety (0)

```
void foo() {
    /* SIGINT might happen while foo() is running */
    char *p = malloc(1024);
    ...
}

/* signal handler for SIGINT
   (registered elsewhere with sigaction()) */
void handle_sigint() {
    printf("You\u2014pressed\u2014control-C.\n");
}
```

signal handler unsafety (1)

```
void *malloc(size_t size) {  
    ...  
    to_return = next_to_return;  
    /* SIGNAL HAPPENS HERE */  
    next_to_return += size;  
    return to_return;  
}  
  
void foo() {  
    /* This malloc() call interrupted */  
    char *p = malloc(1024);  
    p[0] = 'x';  
}  
  
void handle_sigint() {  
    // printf might use malloc()  
    printf("You pressed control-C.\n");  
}
```

signal handler unsafety (1)

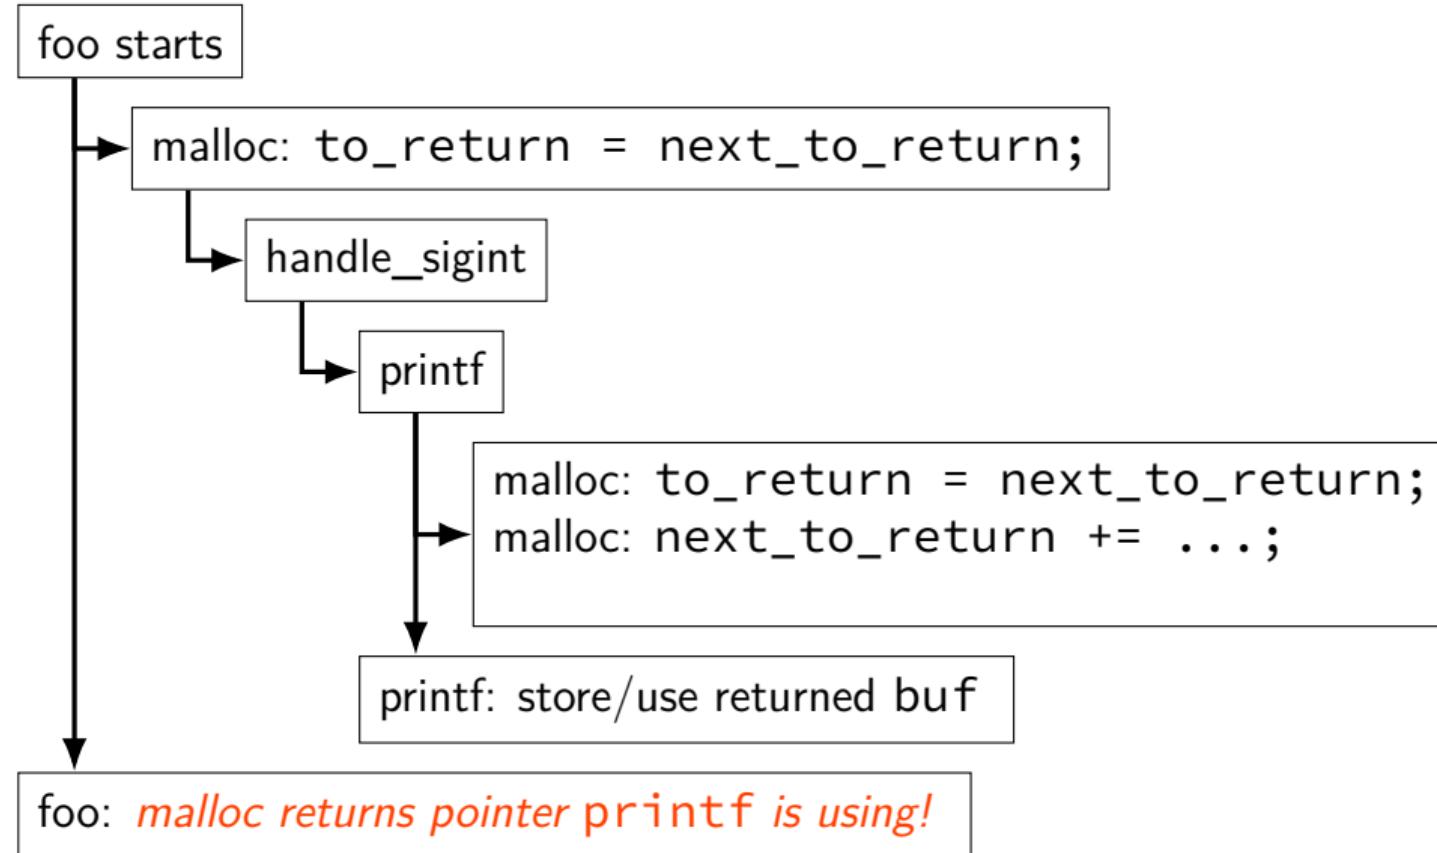

```
void *malloc(size_t size) {  
    ...  
    to_return = next_to_return;  
    /* SIGNAL HAPPENS HERE */  
    next_to_return += size;  
    return to_return;  
}  
  
void foo() {  
    /* This malloc() call interrupted */  
    char *p = malloc(1024);  
    p[0] = 'x';  
}  
  
void handle_sigint() {  
    // printf might use malloc()  
    printf("You pressed control-C.\n");  
}
```

signal handler unsafety (2)

```
void handle_sigint() {
    printf("You\u2014pressed\u2014control-C.\n");
}

int printf(...) {
    static char *buf;
    ...
    buf = malloc()
    ...
}
```

signal handler unsafety: timeline

signal handler unsafety (3)

```
foo() {
    char *p = malloc(1024)... {
        to_return = next_to_return;
        handle_sigint() { /* signal delivered here */
            printf("You\u201dpressed\u201dcontrol-C.\n") {
                buf = malloc(...) {
                    to_return = next_to_return;
                    next_to_return += size;
                    return to_return;
                }
                ...
            }
        }
        next_to_return += size;
        return to_return;
    }
    /* now p points to buf used by printf! */
}
```

signal handler unsafety (3)

```
foo() {
    char *p = malloc(1024)... {
        to_return = next_to_return;
        handle_sigint() { /* signal delivered here */
            printf("You\u201dpressed\u201dcontrol-C.\n") {
                buf = malloc(...) {
                    to_return = next_to_return;
                    next_to_return += size;
                    return to_return;
                }
                ...
            }
        }
        next_to_return += size;
        return to_return;
    }
    /* now p points to buf used by printf! */
}
```

signal handler safety

POSIX (standard that Linux follows) defines “async-signal-safe” functions

`man signal-safety` can get you list on portal

these must work correctly no matter what they interrupt

...and no matter how they are interrupted

includes: `write`, `_exit`

does not include: `printf`, `malloc`, `exit`

blocking signals

avoid having signal handlers anywhere:

can instead *block signals*

`sigprocmask()`, `pthread_sigmask()`

blocked = signal handler doesn't run

also called "masking" a signal

blocked signals are not *delivered* (acted on)

instead, signal becomes *pending*

delivered if unblocked

blocking signals

avoid having signal handlers anywhere:

can instead *block signals*

`sigprocmask()`, `pthread_sigmask()`

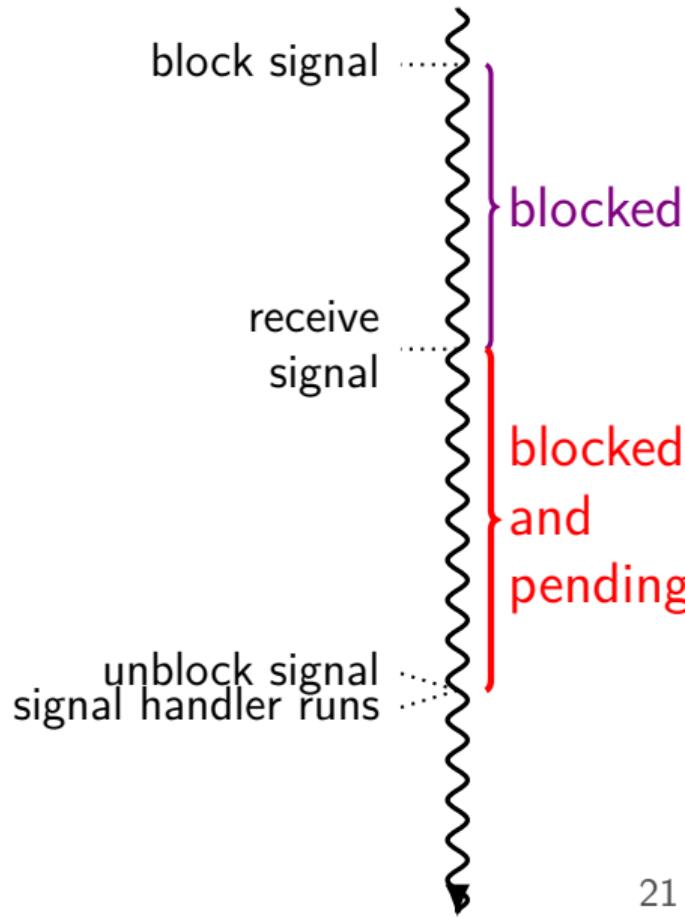

blocked = signal handler doesn't run

also called "masking" a signal

blocked signals are not *delivered* (acted on)

instead, signal becomes *pending*

delivered if unblocked

controlling when signals are handled

first, block a signal

then either unblock signals only at certain times

some special functions to help:

`sigsuspend` (unblock and wait until handler runs),

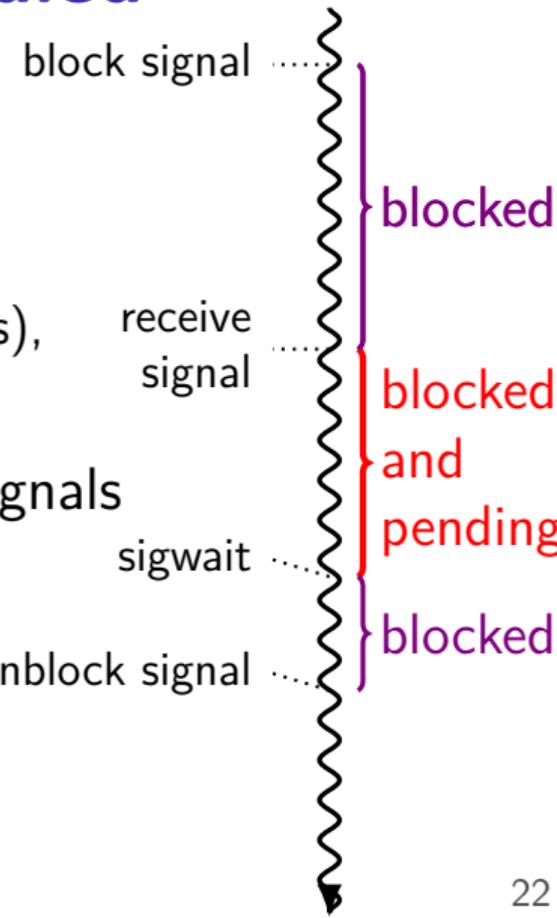

`pselect` (unblock while checking for I/O), ...

and/or use API for checking/changing pending signals

example: `sigwait`

(wait for blocked signal to become pending;
then mark not pending)

typically *instead of having signal handler*

controlling when signals are handled

first, block a signal

then either unblock signals only at certain times

some special functions to help:

`sigsuspend` (unblock and wait until handler runs),

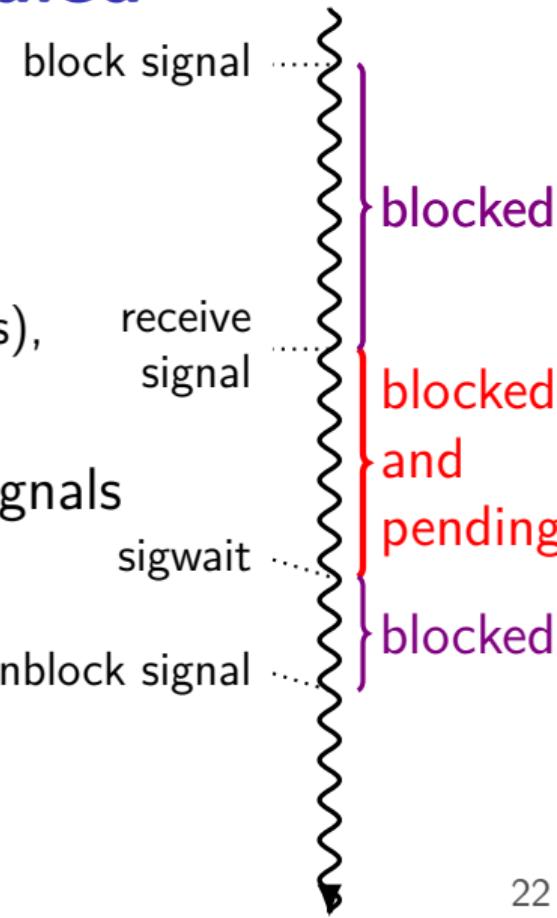

`pselect` (unblock while checking for I/O), ...

and/or use API for checking/changing pending signals

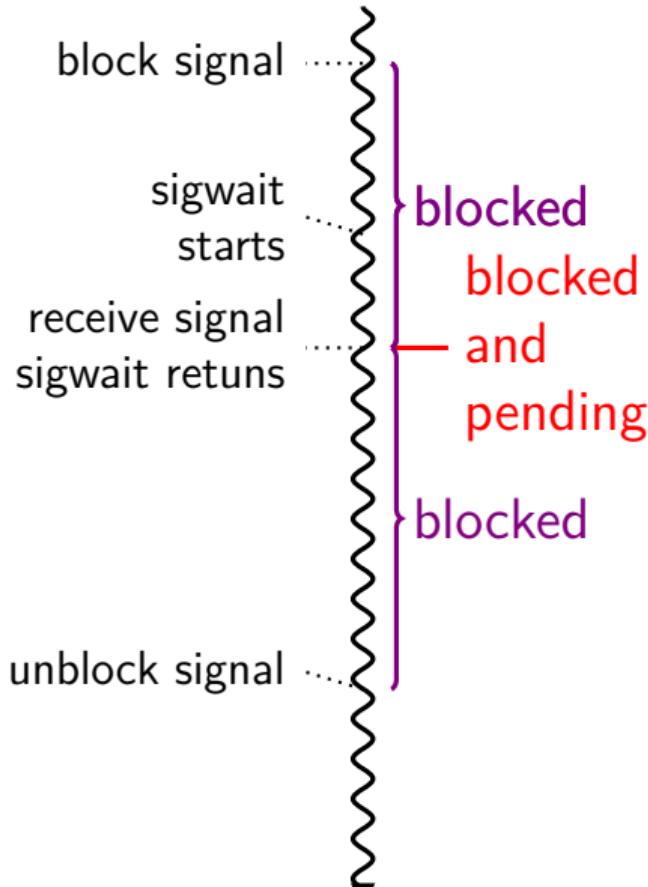

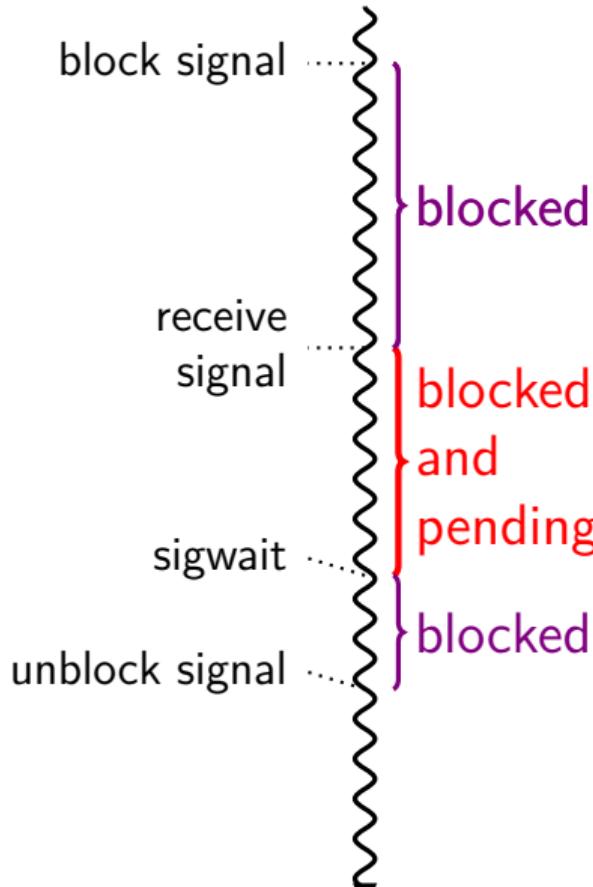

example: `sigwait`

(wait for blocked signal to become pending;
then mark not pending)

typically *instead of having signal handler*

sigwait timelines

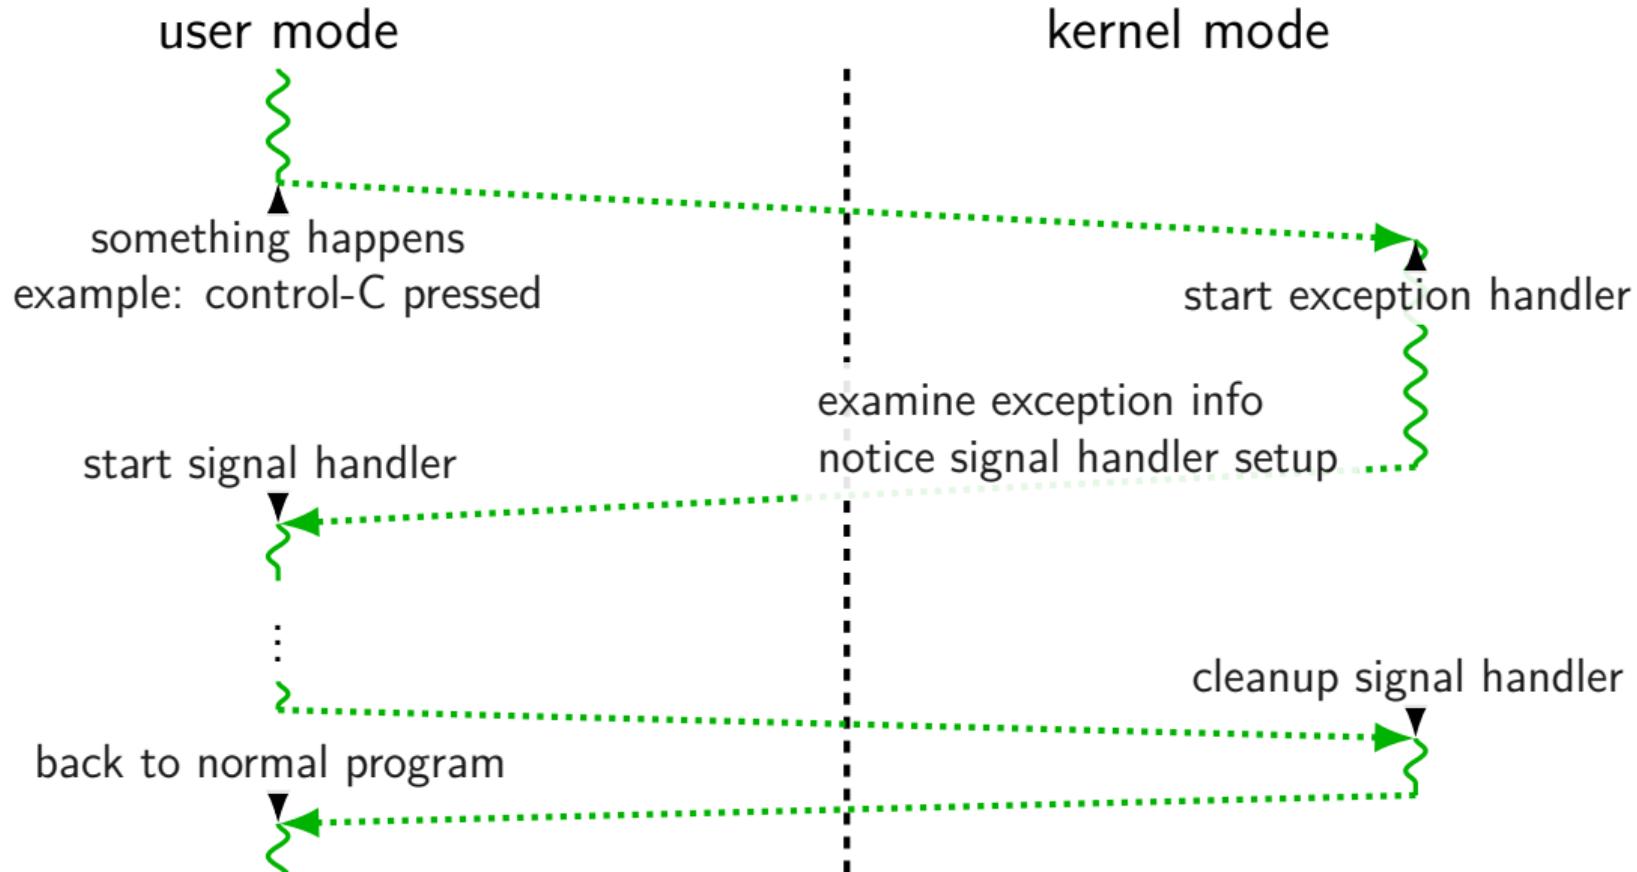

synchronous signal handling

```
int main(void) {
    sigset_t set;
    sigemptyset(&set);
    sigaddset(&set, SIGINT);
    sigprocmask(SIG_BLOCK, &set, NULL);

    printf("Waiting for SIGINT (control-C)\n");
    int num;
    if (sigwait(&set, &num) != 0) {
        printf("sigwait failed!\n");
    }
    if (num == SIGINT);
        printf("Got SIGINT\n");
    }
}
```

'forwarding' exception as signal

'forwarding' exception as signal

x86-64 Linux signal delivery (1)

suppose: signal (with handler) happens while `foo()` is running

should stop in the middle of `foo()`

do signal handler

go back to `foo()` without...

changing local variables (possibly in registers)

(and `foo()` doesn't have code to do that)

x86-64 Linux signal delivery (1)

suppose: signal (with handler) happens while `foo()` is running

should stop in the middle of `foo()`

do signal handler

go back to `foo()` *without...*

changing local variables (possibly in registers)

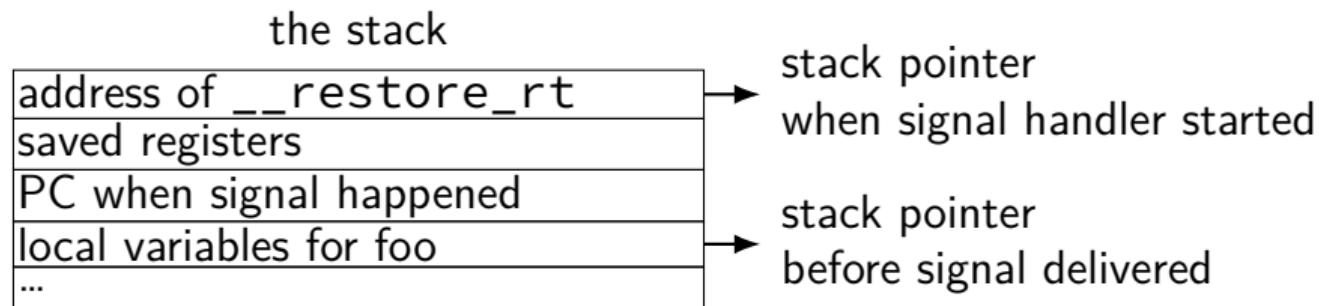

(and `foo()` doesn't have code to do that)

x86-64 Linux signal delivery (2)

suppose: signal (with handler) happens while `foo()` is running

OS saves registers *to user stack*

OS modifies user registers, PC to call signal handler

x86-64 Linux signal delivery (3)

```
handle_sigint:  
    ...  
    ret  
...  
__restore_rt:  
    // 15 = "sigreturn" system call  
    movq $15, %rax  
    syscall
```

`__restore_rt` is *return address* for signal handler

`sigreturn` syscall restores pre-signal state

- if `SA_RESTART` set, restarts interrupted operation

- also handles caller-saved registers

- also might change which signals blocked (depending how `sigaction` was called)

SA_RESTART

```
struct sigaction sa; ...
sa.sa_flags = SA_RESTART;
```

general version:

```
sa.sa_flags = SA_NAME | SA_NAME | SA_NAME; (or 0)
```

if SA_RESTART included:

after signal handler runs, attempt to restart interrupted operations (e.g. reading from keyboard)

if SA_RESTART not included:

after signal handler runs, interrupted operations return typically an error (detect by checking `errno == EINTR`)

sending signals (1)

pid 1000

```
void handle_usr1(int num) {
    write(1, "Y", 1);
    kill(2000, SIGUSR2);
}

void handle_usr1(int num) {
    write(1, "Y", 1);
    kill(2000, SIGUSR2);
}

int main() {
    struct sigaction act;
    ... // initialize act
    act.sa_handler = &handle_usr1;
    sigaction(SIGUSR1, &act, NULL);
    sleep(60); // wait for pid 2000 to start
    kill(2000, SIGUSR1);
    while (1) pause();
}
```

pid 2000

```
void handle_usr1(int num) {
    write(1, "X", 1);
    kill(1000, SIGUSR1);
}

void handle_usr2(int num) {
    write(1, "Z", 1);
    kill(1000, SIGTERM);
    _exit(0);
}

int main() {
    struct sigaction act;
    ... // initialize act
    act.sa_handler = &handle_usr1;
    sigaction(SIGUSR1, &act, NULL);
    act.sa_handler = &handle_usr2;
    sigaction(SIGUSR2, &act, NULL);
    while (1) pause();
}
```
