

## Synchronization 2: Locks (part 2), Mutexes

# load/store reordering

recall: out-of-order processors

processors execute instructions in different order

hide delays from slow caches, variable computation rates, etc.

convenient optimization: execute loads/stores in different order

# why load/store reordering?

prior example: load of x executing before store of y

why do this? otherwise delay the load

if x and y unrelated — no benefit to waiting

# some x86 reordering restrictions

each core sees its own loads/stores in order

(if a core store something, it can always load it back)

stores *from other cores* appear in a consistent order

(but a core might observe its own stores “too early”)

causality: if a core reads X, then writes Y, no core can observe the read of Y before the read X

# how do you do anything with this?

special instructions with stronger ordering rules

special instructions that restrict ordering of instructions around them (“fences”)

loads/stores can't cross the fence

# compilers changes loads/stores too (1)

```
void Alice() {  
    note_from_alice = 1;  
    do {} while (note_from_bob);  
    if (no_milk) {++milk;}  
}
```

---

```
Alice:  
    movl $1, note_from_alice // note_from_alice ← 1  
    movl note_from_bob, %eax // eax ← note_from_bob  
.L2:  
    testl %eax, %eax  
    jne .L2 // while (eax == 0) repeat  
    cmpl $0, no_milk // if (no_milk != 0) ...  
    ...
```

# compilers changes loads/stores too (1)

```
void Alice() {  
    note_from_alice = 1;  
    do {} while (note_from_bob);  
    if (no_milk) {++milk;}  
}
```

---

```
Alice:  
    movl $1, note_from_alice    // note_from_alice ← 1  
    movl note_from_bob, %eax    // eax ← note_from_bob  
.L2:  
    testl %eax, %eax  
    jne .L2                    // while (eax == 0) repeat  
    cmpl $0, no_milk           // if (no_milk != 0) ...  
    ...
```

## compilers changes loads/stores too (2)

```
void Alice() {  
    note_from_alice = 1;  
    do {} while (note_from_bob);  
    if (no_milk) {++milk;}  
    note_from_alice = 2;  
}
```

---

```
Alice: // don't set note_from_alice to 1, since set to 2 anyway  
    movl note_from_bob, %eax // eax ← note_from_bob  
.L2:  
    testl %eax, %eax  
    jne .L2 // while (eax == 0) repeat  
    ...  
    movl $2, note_from_alice // note_from_alice ← 2
```

## compilers changes loads/stores too (2)

```
void Alice() {  
    note_from_alice = 1;  
    do {} while (note_from_bob);  
    if (no_milk) {++milk;}  
    note_from_alice = 2;  
}
```

---

```
Alice: // don't set note_from_alice to 1, since set to 2 anyway  
    movl note_from_bob, %eax // eax ← note_from_bob  
.L2:  
    testl %eax, %eax  
    jne .L2 // while (eax == 0) repeat  
    ...  
    movl $2, note_from_alice // note_from_alice ← 2
```

## compilers changes loads/stores too (2)

```
void Alice() {  
    note_from_alice = 1;  
    do {} while (note_from_bob);  
    if (no_milk) {++milk;}  
    note_from_alice = 2;  
}
```

---

```
Alice: // don't set note_from_alice to 1, since set to 2 anyway  
    movl note_from_bob, %eax // eax ← note_from_bob  
.L2:  
    testl %eax, %eax  
    jne .L2 // while (eax == 0) repeat  
    ...  
    movl $2, note_from_alice // note_from_alice ← 2
```

# pthread and reordering

synchronizing pthreads functions **prevent reordering**

everything before function call actually happens before everything after

includes **preventing some optimizations**

e.g. keeping global variable in register for too long

not just pthread\_mutex\_lock/unlock!

includes pthread\_create, pthread\_join, ...

# **GCC: preventing reordering**

intended to help **implementing things like pthread\_mutex\_lock**

builtin functions starting with `__sync` and `__atomic`

prevent CPU reordering *and* prevent compiler reordering

also provide other tools for implementing locks (more later)

could also hand-write assembly code

    compiler can't know what assembly code is doing

# GCC: preventing reordering example (1)

```
void Alice() {
    note_from_alice = 1;
    do {
        __atomic_thread_fence(__ATOMIC_SEQ_CST);
    } while (note_from_bob);
    if (no_milk) {++milk;}
}
```

---

Alice:

```
    movl $1, note_from_alice // note_from_alice ← 1
.L3:
    mfence // make sure store is visible to other cores before
           // not needed on second+ iteration of loop
    cmpl $0, note_from_bob // if (note_from_bob == 0) repeat fe
    jne .L3
    cmpl $0, no_milk
```

# mfence

x86 instruction mfence

make sure all loads/stores in progress finish

...and make sure no loads/stores were started early

fairly expensive

Intel 'Skylake': order 33 cycles + time waiting for pending stores/loads

## GCC: preventing reordering example (2)

```
void Alice() {
    int one = 1;
    __atomic_store(&note_from_alice, &one, __ATOMIC_SEQ_CST);
    do {
    } while (__atomic_load_n(&note_from_bob, __ATOMIC_SEQ_CST));
    if (no_milk) {++milk;}
}
```

---

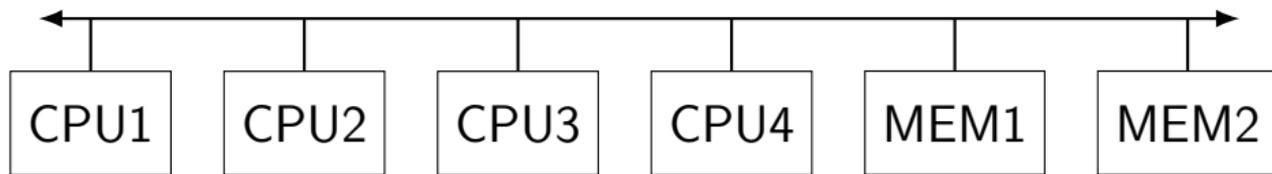

```
Alice:
    movl $1, note_from_alice
    mfence
.L2:
    movl note_from_bob, %eax
    testl %eax, %eax
    jne .L2
    ...
```

# connecting CPUs and memory

multiple processors, common memory

how do processors communicate with memory?

# shared bus

tagged messages — everyone gets everything, filters

contention if multiple communicators

some hardware enforces only one at a time

# shared buses and scaling

shared buses perform poorly with “too many” CPUs

so, there are other designs

we'll gloss over these for now

# shared buses and caches

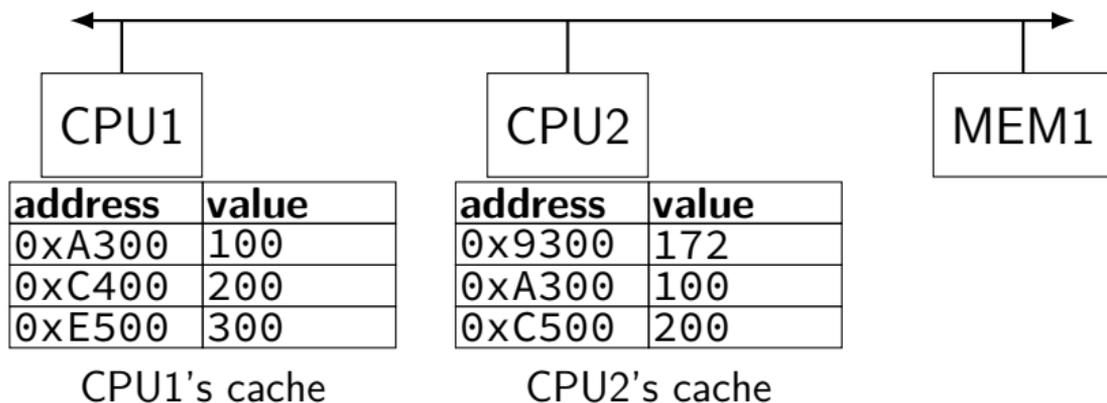

remember caches?

memory is **pretty slow**

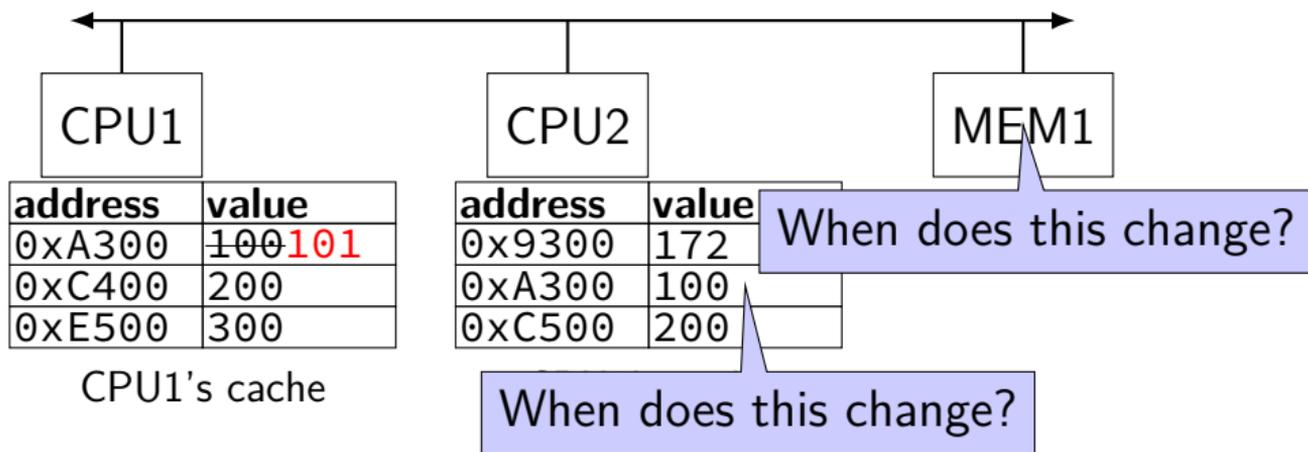

each CPU wants to keep local copies of memory

what happens when multiple CPUs cache same memory?

# the cache coherency problem

# the cache coherency problem

CPU1 writes 101 to 0xA300?

# “snooping” the bus

every processor already receives every read/write to memory

take advantage of this to update caches

idea: use messages to clean up “bad” cache entries

# cache coherency states

extra information for **each cache block**

overlaps with/replaces valid, dirty bits

stored in **each cache**

update states based on reads, writes **and heard messages on bus**

different caches may have different states for same block

# cache coherency states

extra information for **each cache block**

overlaps with/replaces valid, dirty bits

stored in **each cache**

update states based on reads, writes **and heard messages on bus**

different caches may have different states for same block

sample states:

Modified: cache has updated value

Shared: cache is only reading, has same as memory/others

Invalid

# scheme 1: MSI

from state	hear read	hear write	read	write
Invalid	—	—	to Shared	to Modified
Shared	—	to Invalid	—	to Modified
Modified	to Shared	to Invalid	—	—

blue: transition requires sending message on bus

# scheme 1: MSI

from state	hear read	hear write	read	write
Invalid	—	—	to Shared	to Modified
Shared	—	to Invalid	—	to Modified
Modified	to Shared	to Invalid	—	—

blue: transition requires sending message on bus

example: write while Shared

must send write — inform others with Shared state  
then change to Modified

# scheme 1: MSI

from state	hear read	hear write	read	write
Invalid	—	—	to Shared	to Modified
Shared	—	to Invalid	—	to Modified
Modified	to Shared	to Invalid	—	—

blue: transition requires sending message on bus

example: write while Shared

must send write — inform others with Shared state  
then change to Modified

example: hear write while Shared

change to Invalid  
can send read later to get value from writer

example: write while Modified

nothing to do — no other CPU can have a copy

# MSI example

CPU1

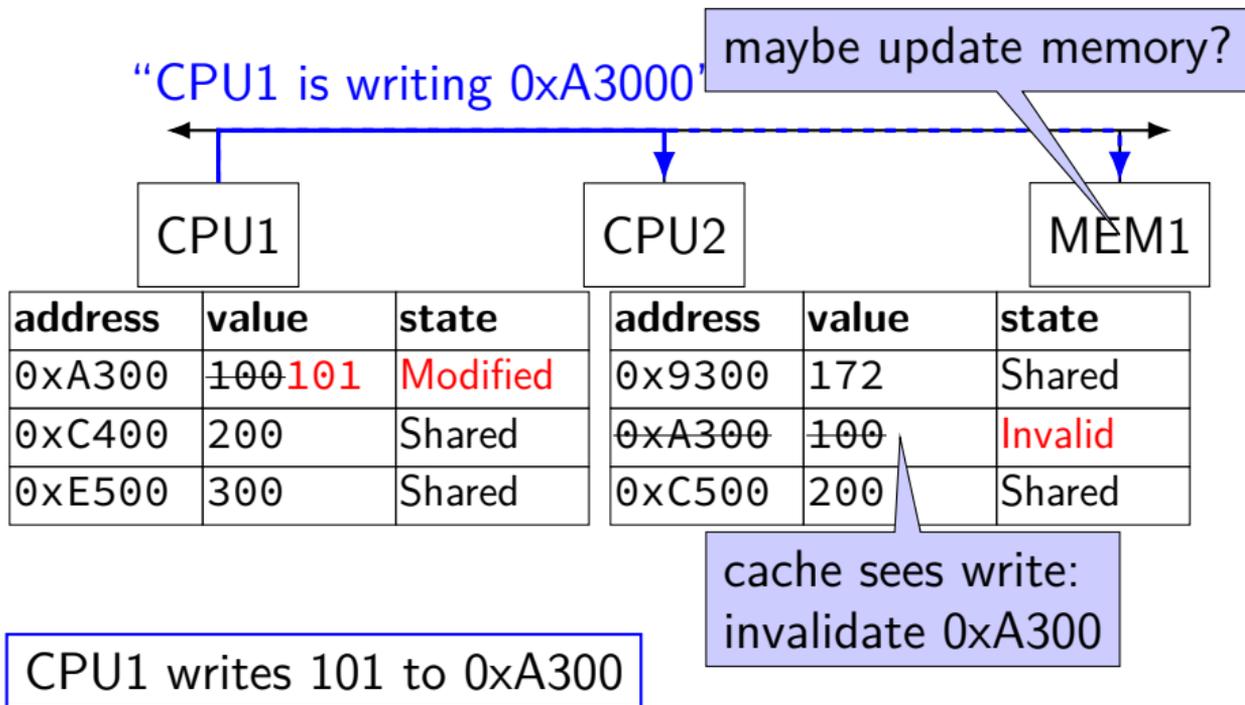

CPU2

MEM1

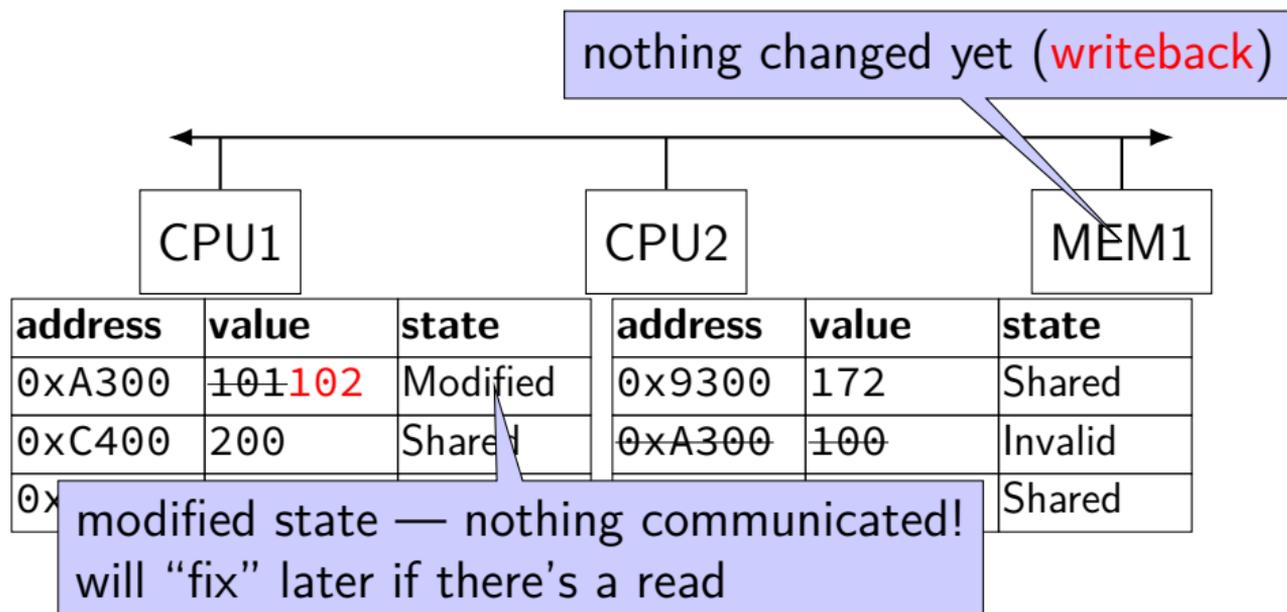

address	value	state
0xA300	100	Shared
0xC400	200	Shared
0xE500	300	Shared

address	value	state
0x9300	172	Shared
0xA300	100	Shared
0xC500	200	Shared

# MSI example

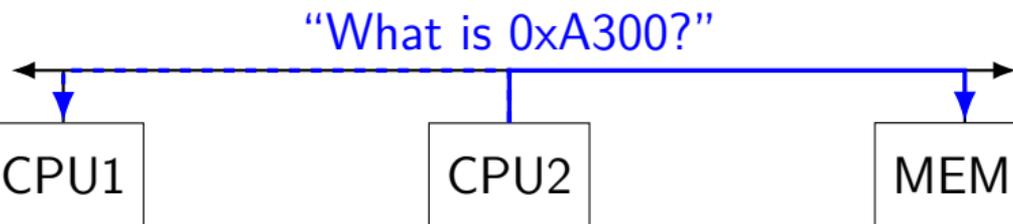

# MSI example

CPU1 writes 102 to 0xA300

# MSI example

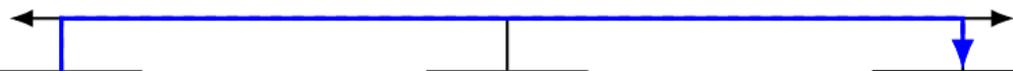

address	value	state	address	value	state
0xA300	102	Modified	0x9300	172	Shared
0xC400	200	Shared	0xA300	100	Invalid
0					Shared

modified state — must update for CPU2!

CPU2 reads 0xA300

# MSI example

“Write 102 into 0xA300”

CPU1

CPU2

MEM1

address	value	state	address	value	state
0xA300	102	Shared	0x9300	172	Shared
0xC400	200	Shared	0xA300	100	Invalid
0xE					Shared

written back to memory early  
(could also become Invalid at CPU1)

CPU2 reads 0xA300

# MSI example

CPU1

CPU2

MEM1

address	value	state
0xA300	102	Shared
0xC400	200	Shared
0xE500	300	Shared

address	value	state
0x9300	172	Shared
0xA300	<del>100</del> 102	Shared
0xC500	200	Shared

## MSI: update memory

to write value (enter modified state), need to **invalidate** others  
can avoid sending actual value (shorter message/faster)

“I am writing address  $X$ ” versus “I am writing  $Y$  to address  $X$ ”

# MSI: on cache replacement/writeback

still happens — e.g. want to store something else

changes state to **invalid**

requires writeback if modified (= dirty bit)

# MSI state summary

**Modified** value may be **different than memory** *and* I am the only one who has it

**Shared** value is the **same as memory**

**Invalid** I don't have the value; I will need to ask for it

# MSI extensions

extra states for *unmodified* values where no other cache has a copy  
avoid sending “I am writing” message later

allow values to be sent directly between caches  
(MSI: value needs to go to memory first)

support not sending invalidate/etc. messages to *all* cores  
requires some tracking of what cores have each address  
only makes sense with non-shared-bus design

# atomic read-modify-write

really hard to build locks for atomic load store  
and normal load/stores aren't even atomic...

...so processors provide **read/modify/write** operations

one instruction that

*atomically*

reads *and* modifies *and* writes back a value

# x86 atomic exchange

```
lock xchg (%ecx), %eax
```

atomic exchange

```
temp ← M[ECX]
```

```
M[ECX] ← EAX
```

```
EAX ← temp
```

...without being interrupted by other processors, etc.

# test-and-set: using atomic exchange

one instruction that...

writes a fixed new value

and reads the old value

# test-and-set: using atomic exchange

one instruction that...

writes a fixed new value

and reads the old value

write: mark a locked as TAKEN (no matter what)

read: see if it was already TAKEN (if so, only us)

# implementing atomic exchange

get cache block into *Modified* state

do read+modify+write operation while state doesn't change

recall: Modified state = "I am the only one with a copy"

# x86-64 spinlock with xchg

lock variable in shared memory: `the_lock`

if 1: someone has the lock; if 0: lock is free to take

acquire:

```
    movl $1, %eax           // %eax ← 1
    lock xchg %eax, the_lock // swap %eax and the_lock
                             // sets the_lock to 1
                             // sets %eax to prior value of the_lock
    test %eax, %eax         // if the_lock wasn't 0 before:
    jne acquire             //   try again
    ret
```

release:

```
    mfence                 // for memory order reasons
    movl $0, the_lock      // then, set the_lock to 0
    ret
```

# x86-64 spinlock with xchg

lock variable in shared memory: `the_lock`

if 1: someone has the lock; if 0: lock is free to take

acquire:

```
movl $1, %eax // %eax ← 1
lock xchg %eax, the_lock // swap: set lock variable to 1 (locked)
                             read old value

test %eax, %eax // if the_lock wasn't 0 before:
jne acquire // try again
ret
```

release:

```
mfence // for memory order reasons
movl $0, the_lock // then, set the_lock to 0
ret
```

# x86-64 spinlock with xchg

lock variable in shared memory: `the_lock`

if 1: someone has the lock; if 0: lock is free to take

acquire:

```
movl $1, %eax
lock xchg %eax, the_lock
```

*// %eax ← 1*

if lock was already locked retry  
“spin” until lock is released elsewhere

```
test %eax, %eax
jne acquire
ret
```

*// if the\_lock wasn't 0 before:  
// try again*

release:

```
mfence
movl $0, the_lock
ret
```

*// for memory order reasons  
// then, set the\_lock to 0*

# x86-64 spinlock with xchg

lock variable in shared memory: `the_lock`

if 1: someone has the lock; if 0: lock is free to take

acquire:

```
movl $1, %eax // %eax ← 1
lock xchg %eax, the_lock
// release lock by setting it to 0 (unlocked)
// allows looping acquire to finish

test %eax, %eax // if the_lock wasn't 0 before:
jne acquire // try again
ret
```

release:

```
mfence // for memory order reasons
movl $0, the_lock // then, set the_lock to 0
ret
```

# x86-64 spinlock with xchg

lock variable in shared memory: `the_lock`

if 1: someone has the lock; if 0: lock is free to take

acquire:

```
movl $1, %eax  
lock xchg %eax, the_lock
```

```
test %eax, %eax  
jne acquire  
ret
```

Intel's manual says:  
no reordering of loads/stores across a `lock`  
or `mfence` instruction

```
// if the_lock wasn't 0 before.  
// try again
```

release:

```
mfence  
movl $0, the_lock  
ret
```

```
// for memory order reasons  
// then, set the_lock to 0
```

of t

# some common atomic operations (1)

```
// x86: emulate with exchange
test-and-set(address) {
    old_value = memory[address];
    memory[address] = 1;
    return old_value != 0; // e.g. set ZF flag
}
```

```
// x86: xchg REGISTER, (ADDRESS)
exchange(register, address) {
    temp = memory[address];
    memory[address] = register;
    register = temp;
}
```

## some common atomic operations (2)

```
// x86: mov OLD_VALUE, %eax; lock cmpxchg NEW_VALUE, (ADDRESS)
```

```
compare_and_swap(address, old_value, new_value) {  
    if (memory[address] == old_value) {  
        memory[address] = new_value;  
        return true;    // x86: set ZF flag  
    } else {  
        return false;  // x86: clear ZF flag  
    }  
}
```

```
// x86: lock xaddl REGISTER, (ADDRESS)
```

```
fetch_and_add(address, register) {  
    old_value = memory[address];  
    memory[address] += register;  
    register = old_value;  
}
```

# append to singly-linked list

```
/*  
    assumption 1: other threads may be appending to list,  
    but nodes are not being removed, reordered, etc.  
  
    assumption 2: the processor will not previous reorder stores  
    into *new_last_node to take place after the  
    store for the compare_and_swap  
*/  
void append_to_list(ListNode *head, ListNode *new_last_node) {  
    ListNode *current_last_node = head;  
    do {  
        while (current_last_node->next) {  
            current_last_node = current_last_node->next;  
        }  
    } while (  
        !compare_and_swap(&current_last_node->next,  
                          NULL, new_last_node)  
    );  
}
```

# common atomic operation pattern

try to acquire lock, or update next pointer, or ...

detect if try failed

if so, repeat

# exercise: fetch-and-add with compare-and-swap

exercise: implement fetch-and-add with compare-and-swap

```
compare_and_swap(address, old_value, new_value) {  
    if (memory[address] == old_value) {  
        memory[address] = new_value;  
        return true;    // x86: set ZF flag  
    } else {  
        return false;  // x86: clear ZF flag  
    }  
}
```

# solution

```
long my_fetch_and_add(long *p, long amount) {
    long old_value;
    do {
        old_value = *p;
        while (!compare_and_swap(p, old_value, old_value + amount));
        return old_value;
    }
}
```

## xv6 spinlock: acquire

```
void
acquire(struct spinlock *lk)
{
    pushcli(); // disable interrupts to avoid deadlock.
    ...
    // The xchg is atomic.
    while(xchg(&lk->locked, 1) != 0)
        ;

    // Tell the C compiler and the processor to not move loads or stores
    // past this point, to ensure that the critical section's memory
    // references happen after the lock is acquired.
    __sync_synchronize();
    ...
}
```

## xv6 spinlock: acquire

```
void
acquire(struct spinlock *lk)
{
    pushcli(); // disable interrupts to avoid deadlock.
    ...
    // The xchg is atomic.
    while(xchg(&lk->locked, 1) != 0)
        ;

    // Tell the C compiler and the processor to not move loads or stores
    // past this point, to ensure that the critical section's memory
    // references happen after the lock is acquired.
    __sync_synchronize();
    ...
}
```

don't want to be waiting for lock  
held by non-running thread

## xv6 spinlock: acquire

```
void
acquire(struct spinlock *lk)
{
    pushcli(); // disable interrupts to avoid deadlock.
    ...
    // The xchg is atomic.
    while(xchg(&lk->locked, 1) != 0)
        ;

    // Tell the C compiler and the processor to not move loads or stores
    // past this point, to ensure that the critical section's memory
    // references happen after the lock is acquired.
    __sync_synchronize();
    ...
}
```

xchg wraps the xchgl instruction  
same as loop above

## xv6 spinlock: acquire

```
void
acquire(struct spinlock *lk)
{
    pushcli(); // disable interrupts to avoid deadlock.
    ...
    // The xchg is atomic.
    while(xchg(&lk->locked, 1) != 0)
        ;

    // Tell the C compiler and the processor to not move loads or stores
    // past this point, to ensure that the critical section's memory
    // references happen after the lock is acquired
    __sync_synchronize();
    ...
}
```

avoid load store reordering (including by compiler)  
on x86, xchg alone avoids processor's reordering  
(but compiler might need more hints)

# xv6 spinlock: release

```
void
release(struct spinlock *lk)
{
    ...
    // Tell the C compiler and the processor to not move loads or stores
    // past this point, to ensure that all the stores in the critical
    // section are visible to other cores before the lock is released.
    // Both the C compiler and the hardware may re-order loads and
    // stores; __sync_synchronize() tells them both not to.
    __sync_synchronize();

    // Release the lock, equivalent to lk->locked = 0.
    // This code can't use a C assignment, since it might
    // not be atomic. A real OS would use C atomics here.
    asm volatile("movl $0, %0" : "+m" (lk->locked) : );

    popcli();
}
```

# xv6 spinlock: release

```
void
release(struct spinlock *lk)
{
    ...
    // Tell the C compiler and the processor to not move loads or stores
    // past this point, to ensure that all the stores in the critical
    // section are visible to other cores before the lock is released.
    // Both the C compiler and the hardware may re-order loads and
    // stores; __sync_synchronize() tells them both not to.
    __sync_synchronize();

    // Release the lock, equivalent to lk->locked = 0.
    // This code can't use a C assignment, since it might
    // not be atomic. A real OS would use C atomics here.
    asm volatile("movl_$0,%0" : "+m" (lk->locked) : );

    popcli();
}
```

# xv6 spinlock: release

```
void
release(struct spinlock *lk)
{
    ...
    // Tell the C compiler and the processor to not move loads or stores
    // past this point, to ensure that all the stores in the critical
    // section are visible to other cores before the lock is released.
    // Both the C compiler and the hardware may re-order loads and
    // stores; __sync_synchronize() tells them both not to.
    __sync_synchronize();

    // Release the lock, equivalent to lk->locked = 0.
    // This code can't use a C assignment, since it might
    // not be atomic. A real OS would use C atomics here.
    asm volatile("movl $0,%0" : "+m" (lk->locked) : );

    popcli();
}
```

# xv6 spinlock: release

```
void
release(struct spinlock *lk)
{
    ...
    // Tell the C compiler and the processor to not move loads or stores
    // past this point, to ensure that all the stores in the critical
    // section are visible to other cores before the lock is released.
    // Both the C compiler and the hardware may re-order loads and
    // stores; __sync_synchronize() tells them both not to.
    __sync_synchronize();

    // Release the lock, equivalent to lk->locked = 0.
    // This code can't use a C assignment, since it might
    // not be atomic. A real OS would use C atomics here.
    asm volatile("movl_$0,%0" : "+m" (lk->locked) : );

    popcli();
}
```

# xv6 spinlock: debugging stuff

```

        panic("release");

    lk->pcs[0] = 0;
    lk->cpu = 0;
    ...
}
```

# xv6 spinlock: debugging stuff

```
void acquire(struct spinlock *lk) {
    ...
    if(holding(lk))
        panic("acquire")
    ...
    // Record info about lock acquisition for debugging.
    lk->cpu = mycpu();
    getcallerpcs(&lk, lk->pcs);
}
void release(struct spinlock *lk) {
    if(!holding(lk))
        panic("release");

    lk->pcs[0] = 0;
    lk->cpu = 0;
    ...
}
```

# xv6 spinlock: debugging stuff

```
void acquire(struct spinlock *lk) {
    ...
    if(holding(lk))
        panic("acquire")
    ...
    // Record info about lock acquisition for debugging.
    lk->cpu = mycpu();
    getcallerpcs(&lk, lk->pcs);
}
void release(struct spinlock *lk) {
    if(!holding(lk))
        panic("release");

    lk->pcs[0] = 0;
    lk->cpu = 0;
    ...
}
```

# spinlock problems

spinlocks can send a lot of messages on the shared bus

    makes every non-cached memory access slower...

wasting CPU time waiting for another thread

    could we do something useful instead?

# spinlock problems

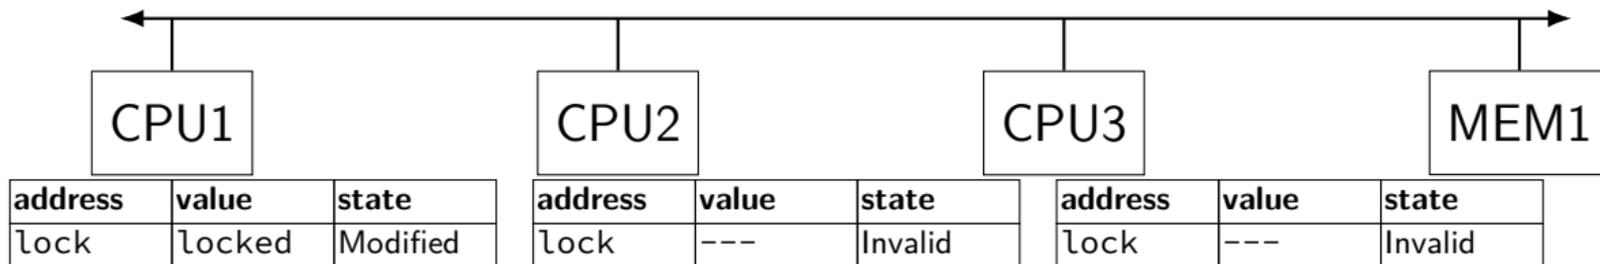

spinlocks can send a lot of messages on the shared bus

makes every non-cached memory access slower...

wasting CPU time waiting for another thread

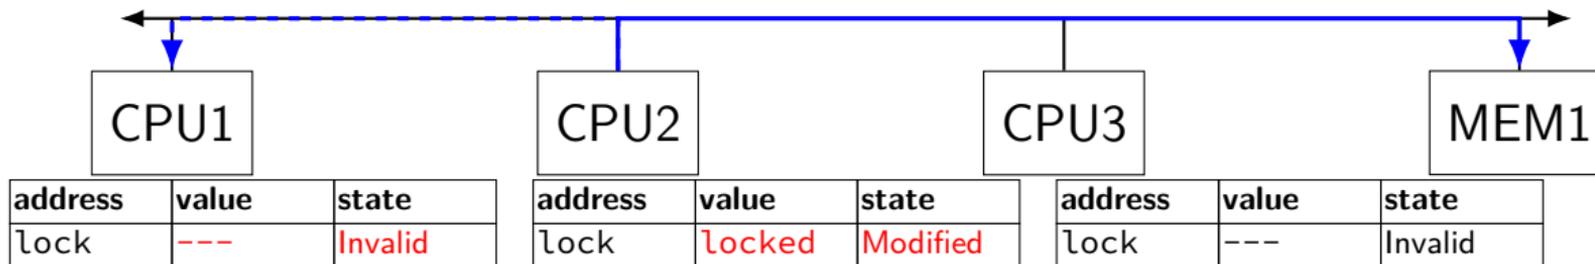

could we do something useful instead?

# ping-ponging

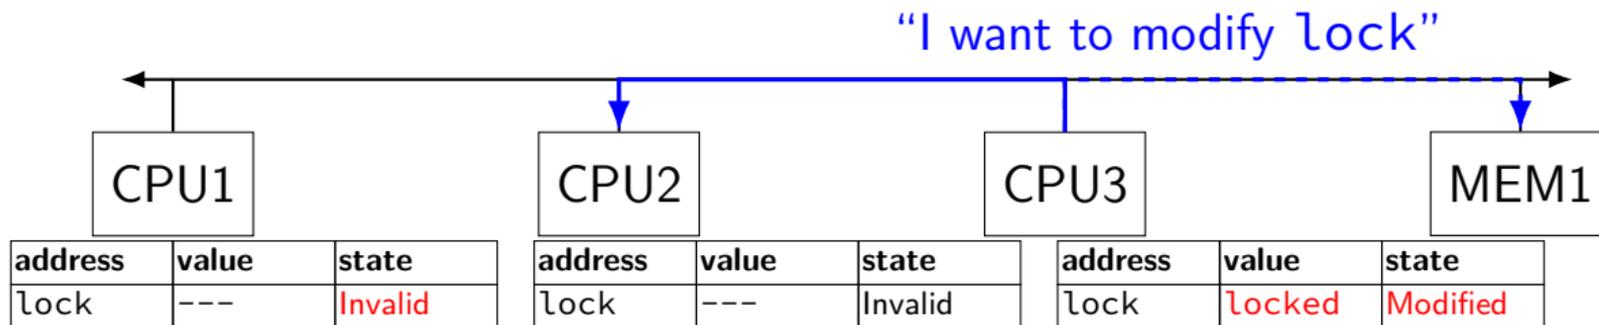

# ping-ponging

“I want to modify lock?”

CPU2 read-modify-writes lock  
(to see it is still locked)

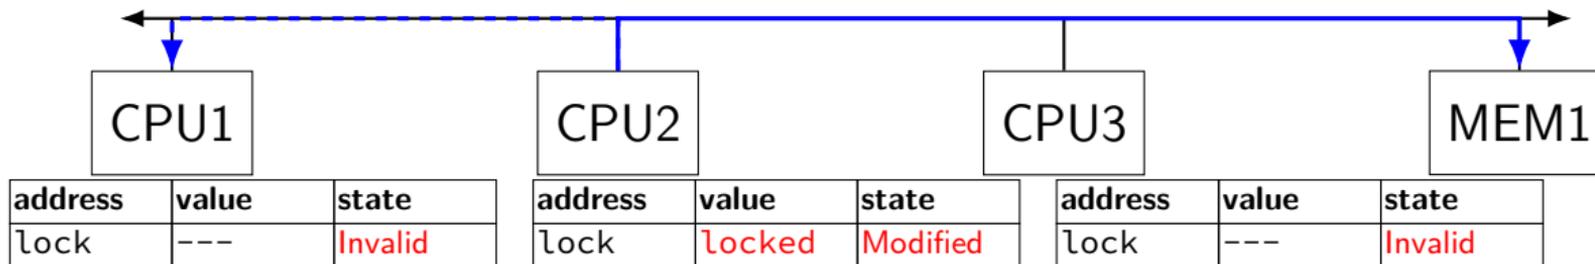

# ping-ponging

CPU3 read-modify-writes lock  
(to see it is still locked)

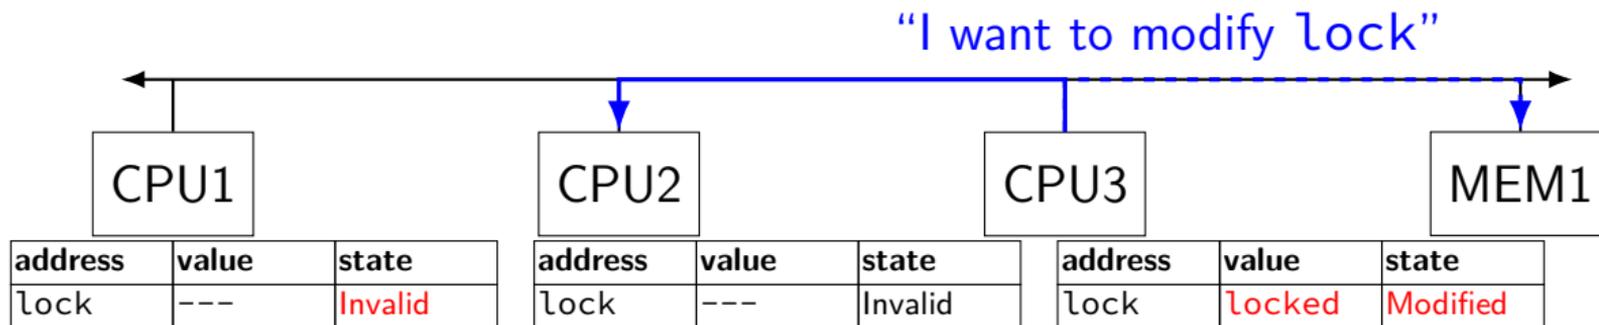

# ping-ponging

“I want to modify lock?”

CPU2 read-modify-writes lock  
(to see it is still locked)

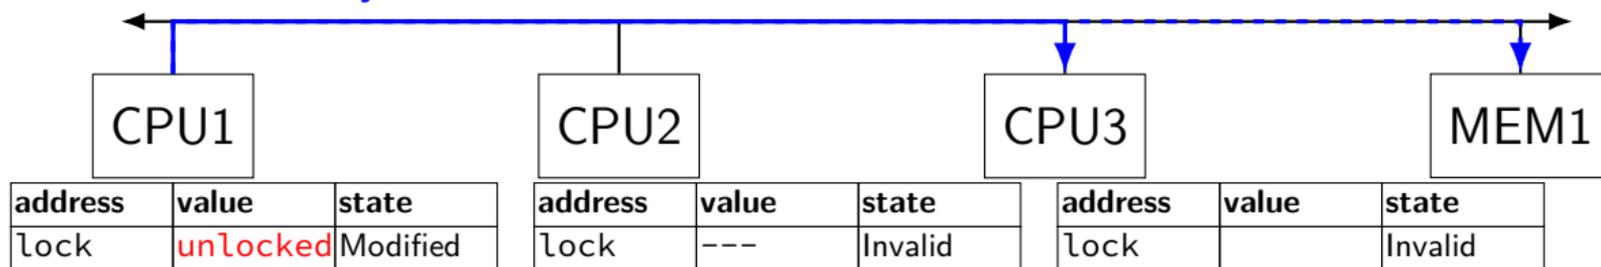

# ping-ponging

CPU3 read-modify-writes lock  
(to see it is still locked)

# ping-ponging

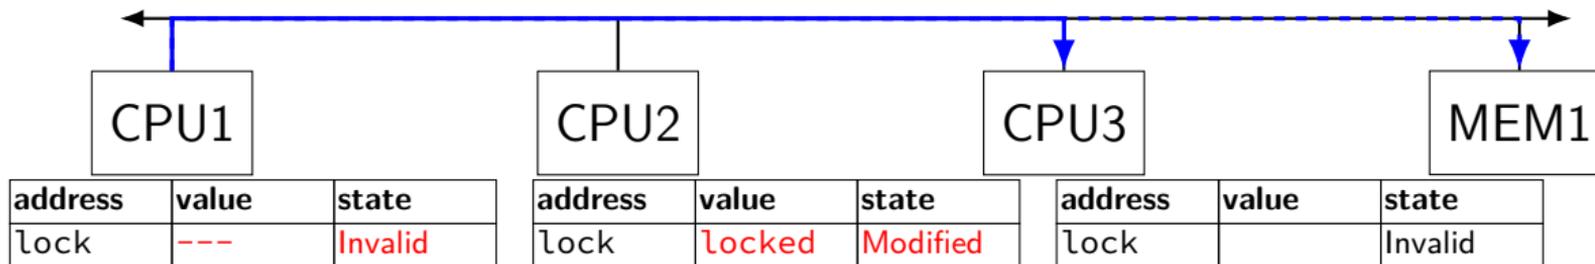

“I want to modify lock”

CPU1 sets lock to unlocked

# ping-ponging

“I want to modify lock”

some CPU (this example: CPU2) acquires lock

# ping-ponging

test-and-set problem: cache block “ping-pongs” between caches

each waiting processor reserves block to modify

each transfer of block sends messages on bus

...so bus can't be used for real work

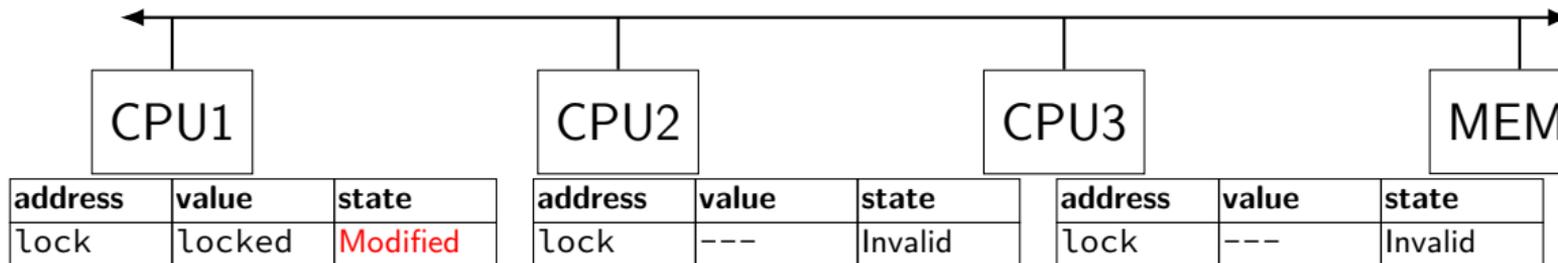

like what the processor with the lock is doing

# test-and-test-and-set

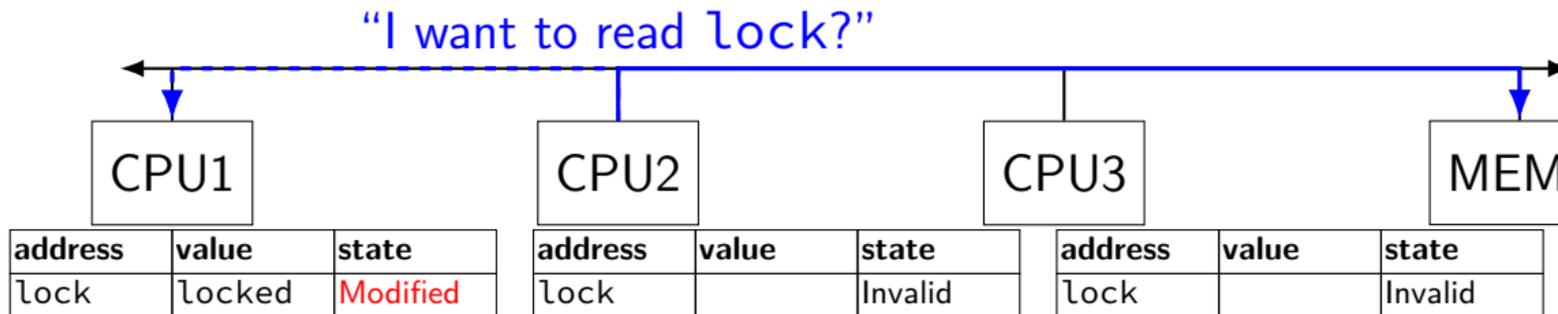

acquire:

```
    cmp $0, the_lock           // test the lock non-atomically
                                // unlike lock xchg --- keeps lock in Shared state!
jne acquire                   // try again (still locked)
// lock possibly free
// but another processor might lock
// before we get a chance to
// ... so try with atomic swap:
movl $1, %eax                 // %eax ← 1
lock xchg %eax, the_lock     // swap %eax and the_lock
                                // sets the_lock to 1
                                // sets %eax to prior value of the_lock
test %eax, %eax               // if the_lock wasn't 0 (someone else
jne acquire                   //   try again
ret
```

# less ping-ponging

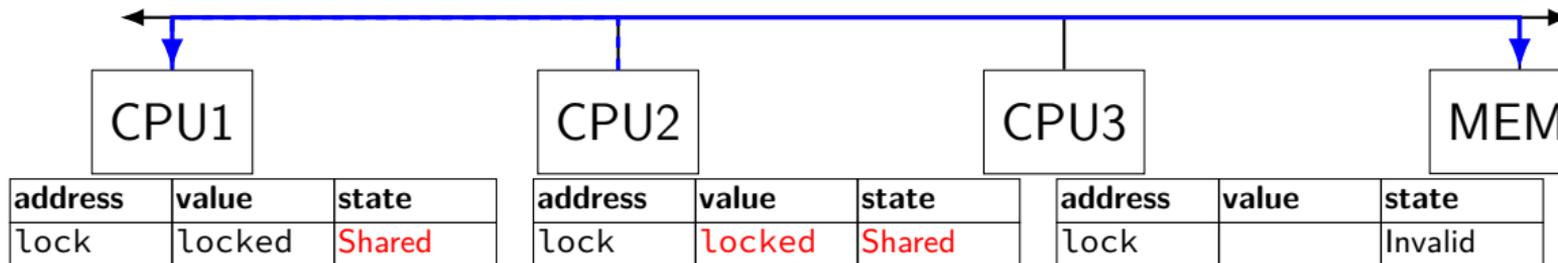

# less ping-ponging

CPU2 reads lock  
(to see it is still locked)

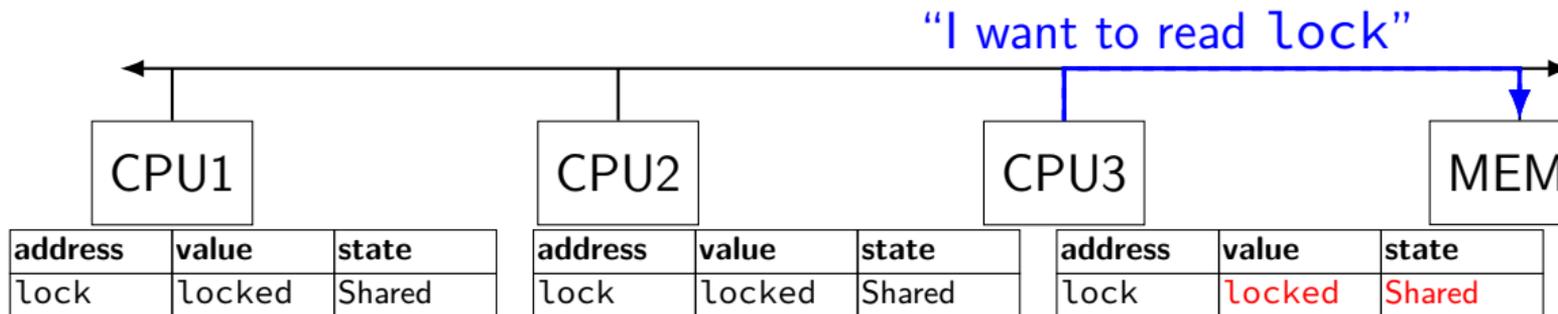

# less ping-ponging

“set lock to locked”

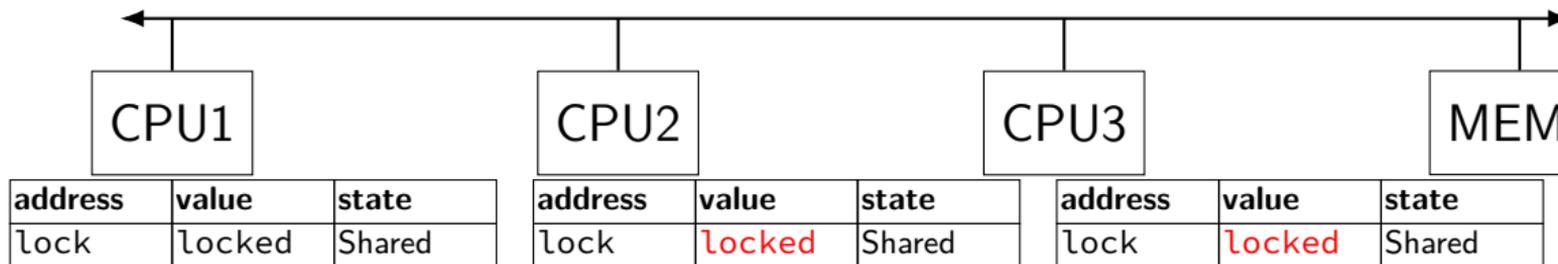

CPU1 writes back lock value,  
then CPU2 reads it

# less ping-ponging

CPU3 reads lock  
(to see it is still locked)

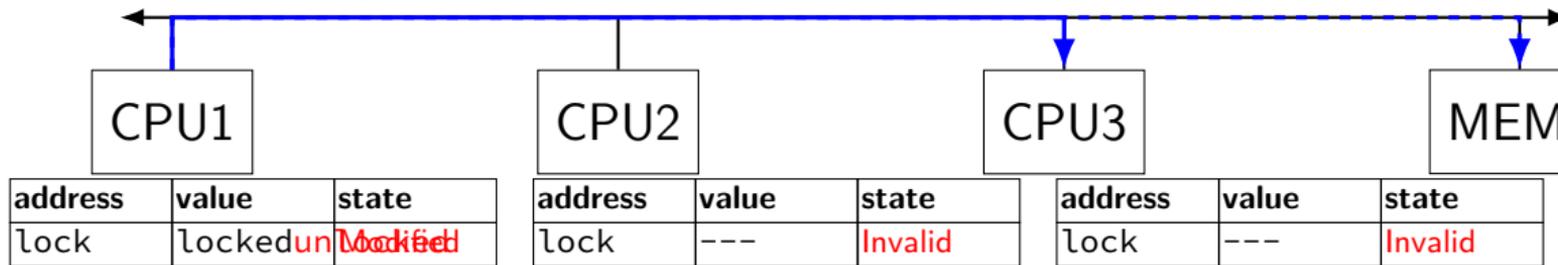

# less ping-ponging

CPU2, CPU3 continue to read lock from cache  
no messages on the bus

# less ping-ponging

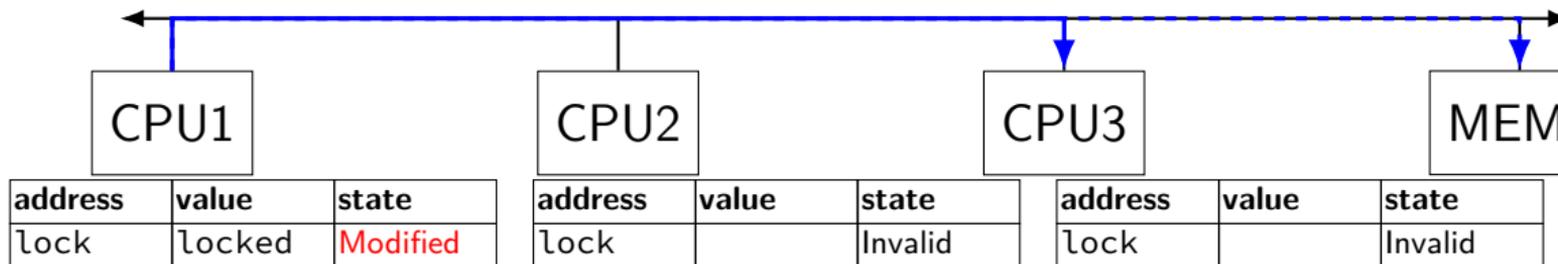

“I want to modify lock”

CPU1 sets lock to unlocked

# less ping-ponging

“I want to modify lock”

some CPU (this example: CPU2) acquires lock  
(CPU1 writes back value, then CPU2 reads + modifies it)

# couldn't the read-modify-write instruction...

notice that the value of the lock isn't changing...

and keep it in the shared state

maybe — but extra step in “common” case (swapping different values)

# more room for improvement?

can still have a lot of attempts to modify locks after unlocked

there other spinlock designs that avoid this

- ticket locks

- MCS locks

- ...

# modifying cache blocks in parallel

cache coherency works on **cache blocks**

but typical memory access — less than cache block

e.g. one 4-byte array element in 64-byte cache block

what if two processors modify different parts same cache block?

4-byte writes to 64-byte cache block

cache coherency — write instructions happen one at a time:

processor 'locks' 64-byte cache block, fetching latest version

processor updates 4 bytes of 64-byte cache block

later, processor might give up cache block

# modifying things in parallel (code)

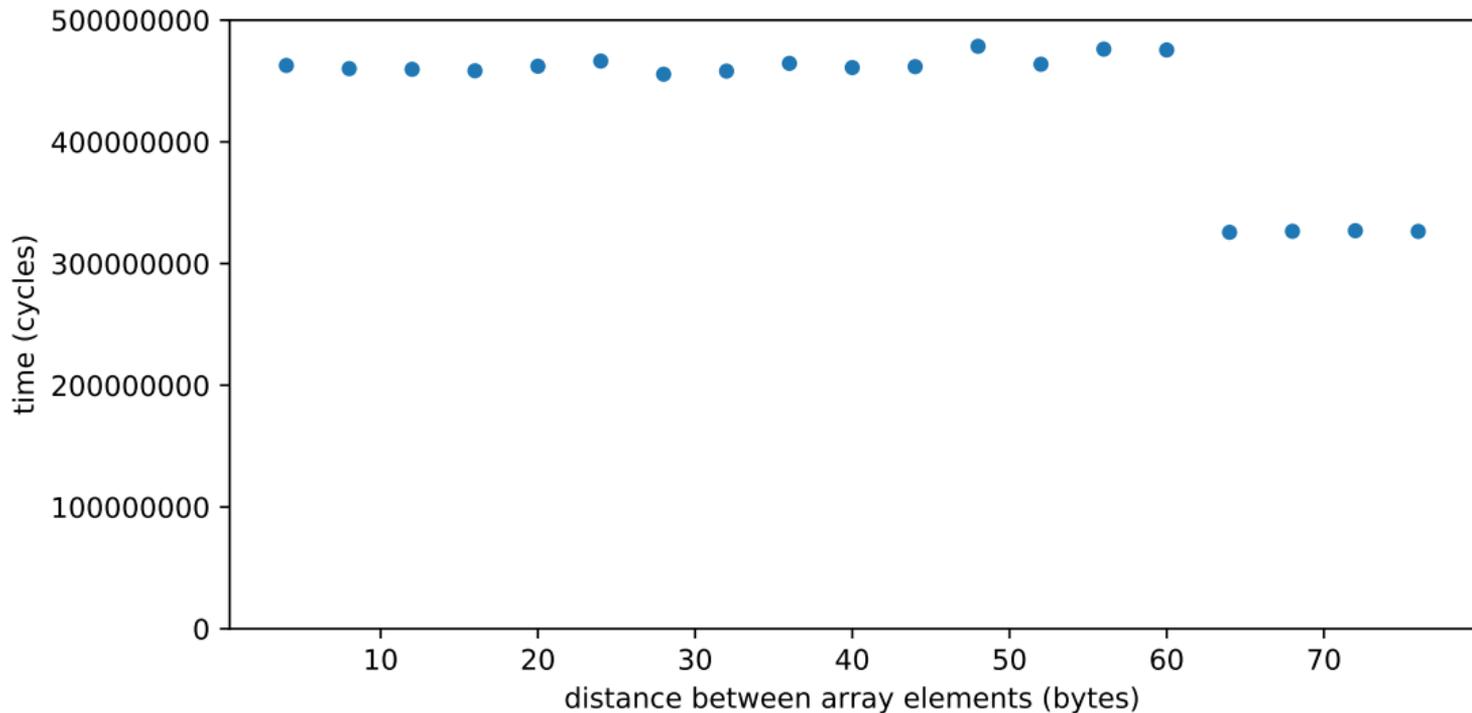

```
void *sum_up(void *raw_dest) {
    int *dest = (int *) raw_dest;
    for (int i = 0; i < 64 * 1024 * 1024; ++i) {
        *dest += data[i];
    }
}
```

```
__attribute__((aligned(4096)))
int array[1024]; /* aligned = address is mult. of 4096 */
```

```
void sum_twice(int distance) {
    pthread_t threads[2];
    pthread_create(&threads[0], NULL, sum_up, &array[0]);
    pthread_create(&threads[1], NULL, sum_up, &array[distance]);
    pthread_join(threads[0], NULL);
    pthread_join(threads[1], NULL);
}
```

# performance v. array element gap

(assuming `sum_up` compiled to not omit memory accesses)

# false sharing

synchronizing to access two independent things

two parts of same cache block

solution: separate them

# spinlock problems

spinlocks can send a lot of messages on the shared bus  
makes every non-cached memory access slower...

wasting CPU time waiting for another thread  
could we do something useful instead?

## problem: busy waits

```
while(xchg(&lk->locked, 1) != 0)  
    ;
```

what if it's going to be a while?

waiting for process that's waiting for I/O?

really would like to do something else with CPU instead...

# mutexes: intelligent waiting

mutexes — locks that wait better

operations still: lock, unlock

instead of running infinite loop, give away CPU

lock = go to sleep, add self to list

unlock = wake up sleeping thread

one idea: use spinlocks to build mutexes

spinlock protects list of waiters from concurrent modification

# mutexes: intelligent waiting

mutexes — locks that wait better

operations still: lock, unlock

instead of running infinite loop, give away CPU

lock = go to sleep, add self to list

unlock = wake up sleeping thread

one idea: use spinlocks to build mutexes

spinlock protects list of waiters from concurrent modification

# mutexes: intelligent waiting

mutexes — locks that wait better

operations still: lock, unlock

instead of running infinite loop, give away CPU

lock = go to sleep, add self to list

unlock = wake up sleeping thread

one idea: use spinlocks to build mutexes

**spinlock protects list of waiters** from concurrent modification

# mutex: one possible implementation

```
struct Mutex {  
    SpinLock guard_spinlock;  
    bool lock_taken = false;  
    WaitQueue wait_queue;  
};
```

# mutex: one possible implementation

```
struct Mutex {  
    SpinLock guard_spinlock;  
    bool lock_taken = false;  
    WaitQueue wait_queue;  
};
```

spinlock protecting `lock_taken` and `wait_queue`  
only held for very short amount of time (compared to mutex itself)

# mutex: one possible implementation

```
struct Mutex {  
    SpinLock guard_spinlock;  
    bool lock_taken = false;  
    WaitQueue wait_queue;  
};
```

tracks whether any thread has locked and not unlocked

# mutex: one possible implementation

```
struct Mutex {  
    SpinLock guard_spinlock;  
    bool lock_taken = false;  
    WaitQueue wait_queue;  
};
```

list of threads that discovered lock is taken  
and are waiting for it be free  
these threads are **not runnable**

# mutex: one possible implementation

```
struct Mutex {  
    SpinLock guard_spinlock;  
    bool lock_taken = false;  
    WaitQueue wait_queue;  
};
```

instead of setting lock\_taken to false  
choose thread to hand-off lock to

```
LockMutex(Mutex *m) {  
    LockSpinlock(&m->guard_spinlock);  
    if (m->lock_taken) {  
        put current thread on m->wait_queue  
        make current thread not runnable  
        /* xv6: myproc()->state = SLEEPING; */  
        UnlockSpinlock(&m->guard_spinlock);  
        run scheduler  
    } else {  
        m->lock_taken = true;  
        UnlockSpinlock(&m->guard_spinlock);  
    }  
}
```

```
UnlockMutex(Mutex *m) {  
    LockSpinlock(&m->guard_spinlock);  
    if (m->wait_queue not empty) {  
        remove a thread from m->wait_queue  
        make that thread runnable  
        /* xv6: myproc()->state = RUNNABLE; */  
    } else {  
        m->lock_taken = false;  
    }  
    UnlockSpinlock(&m->guard_spinlock);  
}
```

# mutex: one possible implementation

```
struct Mutex {
    SpinLock guard_spinlock;
    bool lock_taken = false;
    WaitQueue wait_queue;
};
```

subtle: what if UnlockMutex() runs in between these lines?  
reason why we make thread not runnable before releasing guard spinlock

```
LockMutex(Mutex *m) {
    LockSpinlock(&m->guard_spinlock);
    if (m->lock_taken) {
        put current thread on m->wait_queue
        make current thread not runnable
        /* xv6: myproc()->state = SLEEPING; */
        UnlockSpinlock(&m->guard_spinlock);
        run scheduler
    } else {
        m->lock_taken = true;
        UnlockSpinlock(&m->guard_spinlock);
    }
}
```

```
UnlockMutex(Mutex *m) {
    LockSpinlock(&m->guard_spinlock);
    if (m->wait_queue not empty) {
        remove a thread from m->wait_queue
        make that thread runnable
        /* xv6: myproc()->state = RUNNABLE; */
    } else {
        m->lock_taken = false;
    }
    UnlockSpinlock(&m->guard_spinlock);
}
```

# mutex: one possible implementation

```
struct Mutex {  
    SpinLock guard_spinlock;  
    bool lock_taken = false;  
    WaitQueue wait_queue;  
};
```

```
LockMutex(Mutex *m) {  
    LockSpinlock(&m->guard_spinlock);  
    if (m->lock_taken) {  
        put current thread on m->wait_queue  
        make current thread not runnable  
        /* xv6: myproc()->state = SLEEPING; */  
        UnlockSpinlock(&m->guard_spinlock);  
        run scheduler  
    } else {  
        m->lock_taken = true;  
        UnlockSpinlock(&m->guard_spinlock);  
    }  
}
```

```
UnlockMutex(Mutex *m) {  
    LockSpinlock(&m->guard_spinlock);  
    if (m->wait_queue not empty) {
```

if woken up here, need to make sure scheduler doesn't run us on another core until we switch to the scheduler (and save our regs)  
xv6 solution: acquire ptable lock  
Linux solution: separate 'on cpu' flags

```
}
```

# mutex efficiency

'normal' mutexes more complex than spinlocks  
often implemented using spinlock

observation: **no contention** → **little extra work**  
don't touch wait queue if only one thread at a time

## recall: pthread mutex

```
#include <pthread.h>
```

```
pthread_mutex_t some_lock;
```

```
pthread_mutex_init(&some_lock, NULL);
```

```
// or: pthread_mutex_t some_lock = PTHREAD_MUTEX_INITIALIZER;
```

```
...
```

```
pthread_mutex_lock(&some_lock);
```

```
...
```

```
pthread_mutex_unlock(&some_lock);
```

```
pthread_mutex_destroy(&some_lock);
```

# pthread mutexes: addt'l features

mutex attributes (`pthread_mutexattr_t`) allow:  
(reference: `man pthread.h`)

## error-checking mutexes

locking mutex twice in same thread?

unlocking already unlocked mutex?

...

## mutexes shared between processes

otherwise: must be only threads of same process

(unanswered question: where to store mutex?)

...

# POSIX mutex restrictions

pthread\_mutex rule: **unlock from same thread you lock in**

implementation I gave before — not a problem

...but there other ways to implement mutexes

e.g. might involve comparing with “holding” thread ID

# are locks enough?

do we need more than locks?

## example 1: pipes?

suppose we want to implement a pipe with threads

read sometimes needs to wait for a write

don't want busy-wait

(and trick of having writer unlock() so reader can finish a lock() is illegal)

# more synchronization primitives

need other ways to wait for threads to finish

we'll introduce three extensions of locks for this:

- barriers

- counting semaphores

- condition variables

all implemented with read/modify/write instructions

+ queues of waiting threads

## example 2: parallel processing

compute minimum of 100M element array with 2 processors

algorithm:

compute minimum of 50M of the elements on each CPU

one thread for each CPU

wait for all computations to finish

take minimum of all the minimums

## example 2: parallel processing

compute minimum of 100M element array with 2 processors

algorithm:

compute minimum of 50M of the elements on each CPU

one thread for each CPU

wait for all computations to finish

take minimum of all the minimums

# barriers API

`barrier.Initialize(NumberOfThreads)`

`barrier.Wait()` — return after all threads have waited

idea: multiple threads perform computations in parallel

threads wait for **all other threads** to call `Wait()`

# barrier: waiting for finish

```
barrier.Initialize(2);
```

Thread 0

```
partial_mins[0] =  
    /* min of first  
       50M elems */;  
  
barrier.Wait();  
  
total_min = min(  
    partial_mins[0],  
    partial_mins[1]  
);
```

Thread 1

```
partial_mins[1] =  
    /* min of last  
       50M elems */;  
  
barrier.Wait();
```

## barriers: reuse

barriers are reusable:

Thread 0

```
results[0][0] = getInitial(0);  
barrier.Wait();
```

```
results[1][0] =  
    computeFrom(  
        results[0][0],  
        results[0][1]  
    );  
barrier.Wait();
```

```
results[2][0] =  
    computeFrom(  
        results[1][0],  
        results[1][1]  
    );
```

Thread 1

```
results[0][1] = getInitial(1);  
barrier.Wait();
```

```
results[1][1] =  
    computeFrom(  
        results[0][0],  
        results[0][1]  
    );  
barrier.Wait();
```

```
results[2][1] =  
    computeFrom(  
        results[1][0],  
        results[1][1]  
    );
```

## barriers: reuse

barriers are reusable:

Thread 0

```
results[0][0] = getInitial(0);  
barrier.Wait();
```

```
results[1][0] =  
    computeFrom(  
        results[0][0],  
        results[0][1]  
    );  
barrier.Wait();
```

```
results[2][0] =  
    computeFrom(  
        results[1][0],  
        results[1][1]  
    );
```

Thread 1

```
results[0][1] = getInitial(1);  
barrier.Wait();
```

```
results[1][1] =  
    computeFrom(  
        results[0][0],  
        results[0][1]  
    );  
barrier.Wait();
```

```
results[2][1] =  
    computeFrom(  
        results[1][0],  
        results[1][1]  
    );
```

## barriers: reuse

barriers are reusable:

Thread 0

```
results[0][0] = getInitial(0);  
barrier.Wait();
```

```
results[1][0] =  
    computeFrom(  
        results[0][0],  
        results[0][1]  
    );  
barrier.Wait();
```

```
results[2][0] =  
    computeFrom(  
        results[1][0],  
        results[1][1]  
    );
```

Thread 1

```
results[0][1] = getInitial(1);  
barrier.Wait();
```

```
results[1][1] =  
    computeFrom(  
        results[0][0],  
        results[0][1]  
    );  
barrier.Wait();
```

```
results[2][1] =  
    computeFrom(  
        results[1][0],  
        results[1][1]  
    );
```

# pthread barriers

```
pthread_barrier_t barrier;  
pthread_barrier_init(  
    &barrier,  
    NULL /* attributes */,  
    numberOfThreads  
);  
...  
...  
pthread_barrier_wait(&barrier);
```
