Why is packet delivery in VDTNs non-trivial?

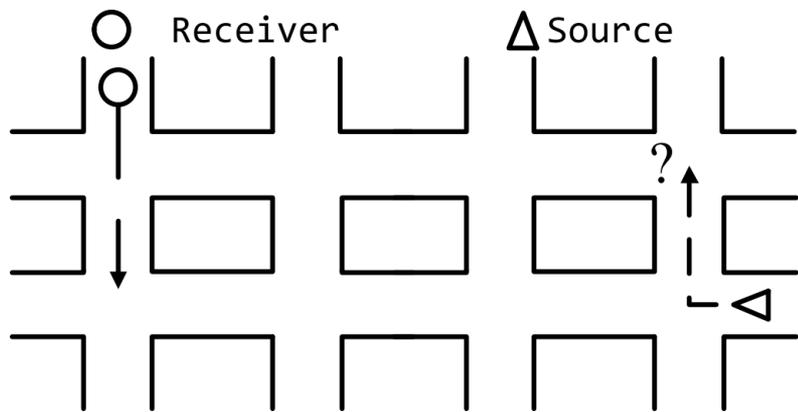

Why is packet delivery in VDTNs non-trivial?

- Highly dynamic mobility of vehicles
- Disconnected nature of VDTNs

Why is packet delivery in VDTNs non-trivial?

- Highly dynamic mobility of vehicles
- Disconnected nature of VDTNs

Efficient and accurate delivery of packet is not easy

1

Use vehicles' historical meeting records to schedule packet forwarding

Insufficiently accurate

1

Use vehicles' historical meeting records to schedule packet forwarding

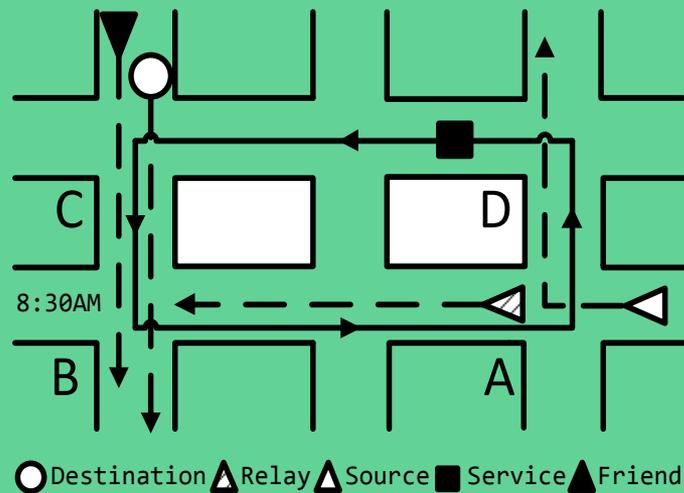

Insufficiently accurate

2

Use vehicles' trajectories to schedule the delivery of packets

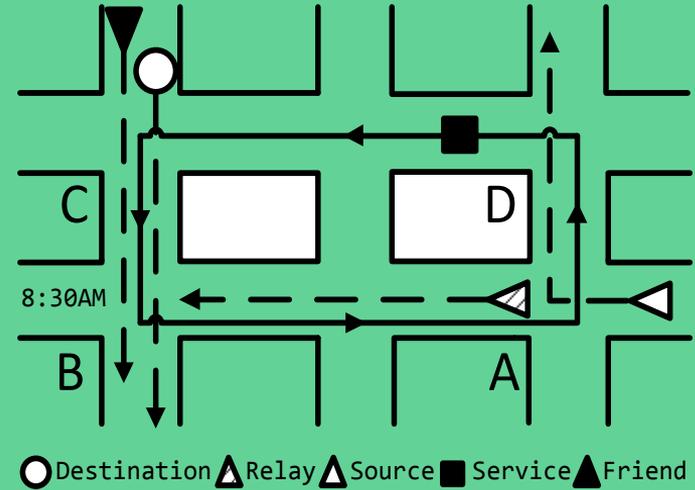

Depend on extra APs

Summary

1. By utilizing vehicles' trajectories, MobiT can schedule the forwarding of packets in a distributed manner.
2. Through combining the vehicles' long-term mobility with their short-term mobility, MobiT can realize accurate and efficient delivery of packets with limited overhead.
3. In the future, we will further exploit vehicles' social relationship for the routing of packets.

Thank you!
