# Fetch, Decode, Execute Instruction Set Architecture

CS 2130: Computer Systems and Organization 1

February 10, 2023

#### Announcements

- · Quiz 3 available today, due Sunday by 11:59pm
- Homework 2 due Monday

## Our story so far

- Information modeled by voltage through wires (1 vs 0)
- Transistors
- Gates: **&** ~
- Multi-bit values: representing integers
- Floating point
- Multi-bit operations using circuits
- Storing results using registers
- Memory

#### Code

How do we run code? What do we need?

## Example Code

```
•••
```

```
8: x = 16
```

9: 
$$y = x$$

10: 
$$x += y$$

•••

What is the value of x after line 10?

## Bookkeeping

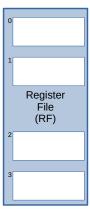

#### What do we need to keep track of?

- Code the program we are running
  - RAM (Random Access Memory)
- State things that may change value (i.e., variables)
  - · Register file can read and write values each cycle
- Program Counter (PC) where we are in our code
  - Single register byte number in memory for next instruction

# Building a Computer

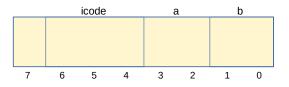

# **Encoding Instructions**

#### Encoding of Instructions (icode or opcode)

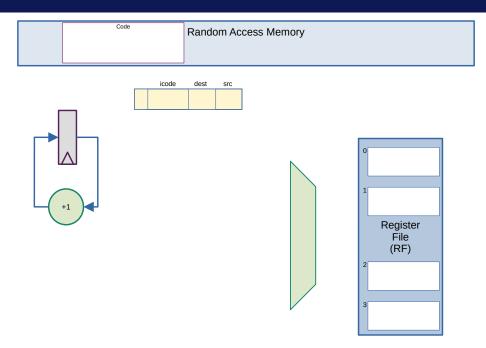

Numeric mapping from icode to operation

#### Example 3-bit icode

icode	meaning
0	rA = rB
1	rA += rB
2	rA &= rB

# Building a Computer

## Question

What happens if we get the 0-byte instruction? 00

# Our Computer's Instructions

## Toy ISA 3-bit icode

icode	meaning
0	rA = rB
1	rA += rB
2	rA &= rB
3	${f r}{f A}$ = read from memory at address ${f r}{f B}$
4	write ${f r}{f A}$ to memory at address ${f r}{f B}$
•••	
7	Compare <b>rA</b> as 8-bit 2's-complement to <b>0</b>
	if rA <= 0 set pc = rB
	else increment <b>pc</b> as normal

# Our Computer's Instructions

Toy ISA 3-bit icode		
icode	b	action
5	0	rA = ~rA
	1	rA = -rA
	2	rA = !rA
	3	rA = pc
6	0	rA = read from memory at pc + 1
	1	rA += read from memory at $pc$ + 1
	2	rA &= read from memory at pc + 1
	3	rA = read from memory at the address stored at $pc + 1$
		For icode 6, increase <b>pc</b> by 2 at end of instruction

## High-level Instructions

In general, 3 kinds of instructions

- moves move values around without doing "work"
- math broadly doing "work"
- jumps jump to a new place in the code

#### Moves

#### Few forms

- Register to register (icode 0), x = y
- Register to/from memory (icodes 3-4), x = M[b], M[b] = x

#### Memory

- · Address: an index into memory.
  - · Addresses are just (large) numbers
  - Usually we will not look at the number and trust it exists and is stored in a register

## Moves

Toy ISA 3-bit icode				
icode	b	action		
0		rA = rB		
3		$\mathbf{r}\mathbf{A}$ = read from memory at address $\mathbf{r}\mathbf{B}$		
4		write ${f r}{f A}$ to memory at address ${f r}{f B}$		
5	3	rA = pc		
6	0	rA = read from memory at pc + 1		
	3	rA = read from memory at the address stored at $pc + 1$		

#### Math

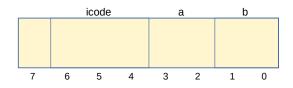

#### Broadly doing work

Toy ISA 3-bit icode			
	icode	b	meaning
	1		rA += rB
	2		rA &= rB
	5	0	rA = ~rA
		1	rA = -rA
		2	rA = !rA
	6	1	rA += read from memory at pc + 1
		2	rA &= read from memory at pc + 1

Note: We can implement other operations using these things!

#### icodes 5 and 6

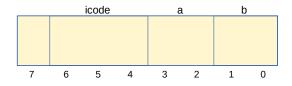

Special property of icodes 5-6: only one register used

# 

#### icodes 5 and 6

Special property of 5-6: only one register used

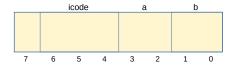

- · Side effect: all bytes between 0 and 127 are valid instructions!
- As long as high-order bit is 0
- · No syntax errors, any instruction given is valid

#### Immediate values

## icode 6 provides literals, **immediate** values

Example 3-bit icode			
icode	b	action	
6	0	rA = read from memory at pc + 1	
	1	rA += read from memory at $pc$ + 1	
	2	rA &= read from memory at pc + 1	
	3	rA = read from memory at the address stored at $pc + 1$	
		For icode 6, increase <b>pc</b> by 2 at end of instruction	

# Encoding Instructions

Example 1: r1 += 19

# Instructions

icode	b	meaning
0		rA = rB
1		rA += rB
2		rA &= rB
3		${f r}{f A}$ = read from memory at address ${f r}{f B}$
4		write ${f r}{f A}$ to memory at address ${f r}{f B}$
5	0	rA = ~rA
	1	rA = -rA
	2	rA = !rA
	3	rA = pc
6	0	rA = read from memory at pc + 1
	1	rA += read from memory at pc + 1
	2	rA &= read from memory at $pc + 1$
	3	rA = read from memory at the address stored at $pc + 1$
		For icode 6, increase <b>pc</b> by 2 at end of instruction
7		Compare <b>rA</b> as 8-bit 2's-complement to <b>0</b>
		if $rA \le 0$ set $pc = rB$
		else increment <b>pc</b> as normal

## **Encoding Instructions**

Example 2: M[0x82] += r3

Read memory at address 0x82, add r3, write back to memory at same address

# Instructions

icode	b	meaning
0		rA = rB
1		rA += rB
2		rA &= rB
3		${f r}{f A}$ = read from memory at address ${f r}{f B}$
4		write ${f r}{f A}$ to memory at address ${f r}{f B}$
5	0	rA = ~rA
	1	rA = -rA
	2	rA = !rA
	3	rA = pc
6	0	rA = read from memory at $pc + 1$
	1	rA += read from memory at pc + 1
	2	rA &= read from memory at $pc + 1$
	3	rA = read from memory at the address stored at $pc + 1$
		For icode 6, increase <b>pc</b> by 2 at end of instruction
7		Compare <b>rA</b> as 8-bit 2's-complement to <b>0</b>
		if $rA \le 0$ set $pc = rB$
		else increment <b>pc</b> as normal

## Jumps

- Moves and math are large portion of our code
- We also need control constructs
  - · Change what we are going to do next
  - if, while, for, functions, ...
- Jumps provide mechanism to perform these control constructs
- We jump by assigning a new value to the program counter PC

## Jumps

For example, consider an **if** 

## Jumps

Example 3-bit icode		
	icode	meaning
	7	Compare <b>rA</b> as 8-bit 2's-complement to <b>0</b>
		if rA <= 0 set pc = rB
		else increment <b>pc</b> as normal

#### Instruction icode 7 provides a conditional jump

 Real code will also provide an unconditional jump, but a conditional jump is sufficient

## Writing Code

We can now write any\* program!

- · When you run code, it is being turned into instructions like ours
- Modern computers use a larger pool of instructions than we have (we will get there)

\*we do have some limitations, since we can only represent 8-bit values and some operations may be tedious.

#### Our code to this machine code

How do we turn our control constructs into jump statements?

# if/else to jump

# while to jump

# **Function Calls**

# **Encoding Instructions**

Example 3: if r0 < 9 jump to 0x42

# Instructions

icode	b	meaning
0		rA = rB
1		rA += rB
2		rA &= rB
3		${f r}{f A}$ = read from memory at address ${f r}{f B}$
4		write ${f r}{f A}$ to memory at address ${f r}{f B}$
5	0	rA = ~rA
	1	rA = -rA
	2	rA = !rA
	3	rA = pc
6	0	rA = read from memory at $pc + 1$
	1	rA += read from memory at pc + 1
	2	rA &= read from memory at pc + 1
	3	rA = read from memory at the address stored at $pc + 1$
		For icode 6, increase <b>pc</b> by 2 at end of instruction
7		Compare <b>rA</b> as 8-bit 2's-complement to <b>0</b>
		if rA <= 0 set pc = rB
		else increment <b>pc</b> as normal
