

# Stacks and Functions, Backdoors

---

CS 2130: Computer Systems and Organization 1

February 27, 2023

# Announcements

- Homework 4 due **Friday** at 11pm on Gradescope
- Lab tomorrow (git and assembly)
- Exam 1 grades coming soon

# Our Instruction Set Architecture

icode	b	meaning
0		$rA = rB$
1		$rA += rB$
2		$rA \&= rB$
3		$rA =$ read from memory at address $rB$
4		write $rA$ to memory at address $rB$
5	0	$rA = \sim rA$
	1	$rA = -rA$
	2	$rA = !rA$
	3	$rA = pc$
6	0	$rA =$ read from memory at $pc + 1$
	1	$rA +=$ read from memory at $pc + 1$
	2	$rA \&=$ read from memory at $pc + 1$
	3	$rA =$ read from memory at the address stored at $pc + 1$ For icode 6, increase $pc$ by 2 at end of instruction
7		Compare $rA$ as 8-bit 2's-complement to $\theta$ if $rA \leq \theta$ set $pc = rB$ else increment $pc$ as normal

What about real ISAs?

# Our Instruction Set Architecture

What about our ISA?

- Enough instructions to compute what we need
- As is, lot of things that are painful to do
  - This was on purpose! So we can see limitations of ISAs early
- Add any number of new instructions using the reserved bit (7)
- Missing something important: *Help to put variables in memory*

# Storing Variables in Memory

So far... we/compiler chose location for variable

Consider the following example:

`f(x):`

`a = x`

`if (x <= 0) return 0`

`else return f(x-1) + a`

Recursion

- The formal study of a function that calls itself

# Storing Variables in Memory

```
f(x):  
  a = x  
  if (x <= 0) return 0  
  else return f(x-1) + a
```

Where do we store a?

# The Stack

**Stack** - a last-in-first-out (LIFO) data structure

- *The* solution for solving this problem

**rsp** - Special register - the *stack pointer*

- Points to a special location in memory
- Two operations most ISAs support:
  - **push** - put a new value on the stack
  - **pop** - return the top value off the stack

# The Stack: Push and Pop

push r0

- Put a value onto the “top” of the stack

`rsp -= 1`

`M[rsp] = r0`

pop r2

- Read value from “top”, save to register

`r2 = M[rsp]`

`rsp += 1`

# The Stack: Push and Pop

# Function Calls

A short aside...

Time to take over the world!

# Backdoors

**Backdoor:** secret way in to do new *unexpected* things

- Get around the normal barriers of behavior
- Ex: a way in to allow me to take complete control of your computer

**Exploit** - a way to use a vulnerability or backdoor that has been created

- Our exploit today: a **malicious payload**
  - A passcode and program
  - If it ever gets in memory, run my program regardless of what you want to do

# Our Hardware Backdoor

Our backdoor will have 2 components

- Passcode: need to recognize when we see the passcode
- Program: do something bad when I see the passcode

# Our Hardware Backdoor

# Our Hardware Backdoor

Will you notice this on your chip?

# Our Hardware Backdoor

Will you notice this on your chip?

- Modern chips have **billions** of transistors
- We're talking adding a few hundred transistors

# Our Hardware Backdoor

Will you notice this on your chip?

- Modern chips have **billions** of transistors
- We're talking adding a few hundred transistors
- *Maybe with a microscope? But you'd need to know where to look!*

# Our Hardware Backdoor

Have you heard about something like this before?

# Our Hardware Backdoor

Have you heard about something like this before?

- Sounds like something from the movies

# Our Hardware Backdoor

Have you heard about something like this before?

- Sounds like something from the movies
- People claim this might be happening

# Our Hardware Backdoor

Have you heard about something like this before?

- Sounds like something from the movies
- People claim this might be happening
- To the best of my knowledge, no one has ever *admitted* to falling in this trap

Are there reasons to do this? Not to do this?

- No technical reason not to, it's easy to do!

Are there reasons to do this? Not to do this?

- No technical reason not to, it's easy to do!
- Ethical implications
- Business implications (lawsuits, PR, etc)

Are there reasons to do this? Not to do this?

- No technical reason not to, it's easy to do!
- Ethical implications
- Business implications (lawsuits, PR, etc)

Can we make a system where one bad actor can't break it?

Are there reasons to do this? Not to do this?

- No technical reason not to, it's easy to do!
- Ethical implications
- Business implications (lawsuits, PR, etc)

Can we make a system where one bad actor can't break it?

- Code reviews, double checks, verification systems, automated verification systems, ...

Why does this work?

# Why?

Why does this work?

- **It's all bytes!**
- Everything we store in computers are bytes
- We store code and data in the same place: memory

# It's all bytes

Memory, Code, Data... It's all bytes!

- **Enumerate** - pick the meaning for each possible byte
- **Adjacency** - store bigger values together (sequentially)
- **Pointers** - a value treated as address of thing we are interested in

# Enumerate

**Enumerate** - pick the meaning for each possible byte

## What is 8-bit 0x54?

Unsigned integer	eighty-four
Signed integer	positive eighty-four
Floating point w/ 4-bit exponent	twelve
ASCII	capital letter T: T
Bitvector sets	The set {2, 3, 5}
Our example ISA	Flip all bits of value in r1

## Adjacency - store bigger values together (sequentially)

- An array: build bigger values out of many copies of the same type of small values
  - Store them next to each other in memory
  - Arithmetic to find any given value based on index
- Records, structures, classes
  - Classes have fields! Store them adjacently
  - Know how to access (add offsets from base address)
  - If you tell me where object is, I can find fields

**Pointers** - a value treated as address of thing we are interested in

- A value that really points to another value
- Easy to describe, hard to use properly
- *We'll be talking about these a lot in this class!*
- Give us strange new powers (represent more complicated things), e.g.,
  - Variable-sized lists
  - Values that we don't know their type without looking
  - Dictionaries, maps

# Programs Use These!

How do our programs use these?

- Enumerated icodes, numbers
- Adjacenty stored instructions (PC+1)
- Pointers of where to jump/goto (addresses in memory)

# Moving On

icode	b	meaning
0		$rA = rB$
1		$rA += rB$
2		$rA \&= rB$
3		$rA =$ read from memory at address $rB$
4		write $rA$ to memory at address $rB$
5	0	$rA = \sim rA$
	1	$rA = -rA$
	2	$rA = !rA$
	3	$rA = pc$
6	0	$rA =$ read from memory at $pc + 1$
	1	$rA +=$ read from memory at $pc + 1$
	2	$rA \&=$ read from memory at $pc + 1$
	3	$rA =$ read from memory at the address stored at $pc + 1$ For icode 6, increase $pc$ by 2 at end of instruction
7		Compare $rA$ as 8-bit 2's-complement to $\theta$ if $rA \leq \theta$ set $pc = rB$ else increment $pc$ as normal

So far, we've been dealing with an 8-bit machine!

# 64-bit Machines

64-bit machine: The **registers** are 64-bits

- i.e., r0, but also PC

Important to have large values. Why?

# 64-bit Machines

64-bit machine: The **registers** are 64-bits

- i.e., r0, but also PC

Important to have large values. Why?

- Most important: PC and memory addresses
- How much memory could our 8-bit machine access?

# 64-bit Machines

64-bit machine: The **registers** are 64-bits

- i.e., r0, but also PC

Important to have large values. Why?

- Most important: PC and memory addresses
- How much memory could our 8-bit machine access? 256 bytes

# 64-bit Machines

- 80s - 32 bits:  $\approx$  4 billion bytes
- Today's processors - 64 bits:  $2^{64}$  addresses

## Aside: Powers of Two

### Powers of Two

Value	base-10	Short form	Pronounced
$2^{10}$	1024	Ki	Kilo
$2^{20}$	1,048,576	Mi	Mega
$2^{30}$	1,073,741,824	Gi	Giga
$2^{40}$	1,099,511,627,776	Ti	Tera
$2^{50}$	1,125,899,906,842,624	Pi	Peta
$2^{60}$	1,152,921,504,606,846,976	Ei	Exa

Example:  $2^{27}$  bytes

## Aside: Powers of Two

### Powers of Two

Value	base-10	Short form	Pronounced
$2^{10}$	1024	Ki	Kilo
$2^{20}$	1,048,576	Mi	Mega
$2^{30}$	1,073,741,824	Gi	Giga
$2^{40}$	1,099,511,627,776	Ti	Tera
$2^{50}$	1,125,899,906,842,624	Pi	Peta
$2^{60}$	1,152,921,504,606,846,976	Ei	Exa

Example:  $2^{27}$  bytes =  $2^7 \times 2^{20}$  bytes

## Aside: Powers of Two

### Powers of Two

Value	base-10	Short form	Pronounced
$2^{10}$	1024	Ki	Kilo
$2^{20}$	1,048,576	Mi	Mega
$2^{30}$	1,073,741,824	Gi	Giga
$2^{40}$	1,099,511,627,776	Ti	Tera
$2^{50}$	1,125,899,906,842,624	Pi	Peta
$2^{60}$	1,152,921,504,606,846,976	Ei	Exa

Example:  $2^{27}$  bytes =  $2^7 \times 2^{20}$  bytes =  $2^7$  MiB = 128 MiB

# 64-bit Machines

How much can we address with 64-bits?

# 64-bit Machines

How much can we address with 64-bits?

- 16 EiB ( $2^{64}$  addresses =  $2^4 \times 2^{60}$ )

# 64-bit Machines

How much can we address with 64-bits?

- 16 EiB ( $2^{64}$  addresses =  $2^4 \times 2^{60}$ )
- But I only have 8 GiB of RAM

# A Challenge

There is a disconnect:

- Registers: 64-bits values
- Memory: 8-bit values (i.e., **1 byte** values)
  - Each address addresses an 8-bit value in memory
  - Each address points to a 1-byte slot in memory

# A Challenge

There is a disconnect:

- Registers: 64-bits values
- Memory: 8-bit values (i.e., **1 byte** values)
  - Each address addresses an 8-bit value in memory
  - Each address points to a 1-byte slot in memory
- How do we store a 64-bit value in an 8-bit spot?

Rules to break “big values” into bytes (memory)

1. Break it into bytes
2. Store them adjacently
3. Address of the overall value = smallest address of its bytes
4. Order the bytes
  - If parts are ordered (i.e., array), first goes in smallest address
  - Else, hardware implementation gets to pick (!!)
    - Little-endian
    - Big-endian

# Ordering Values

## Little-endian

- Store the low order part/byte first
- Most hardware today is little-endian

## Big-endian

- Store the high order part/byte first

# Example

Store [0x1234, 0x5678] at address 0xF00

# Endianness

Why do we study endianness?

- It is **everywhere**
- It is a source of weird bugs
- Ex: It's likely your computer uses:
  - Little-endian from CPU to memory
  - Big-endian from CPU to network
  - File formats are roughly half and half
