

CS4102 Algorithms

Fall 2019

Warm up

Simplify:

$$(1 + a + a^2 + a^3 + a^4 + \dots + a^L)(a - 1) = ?$$

$$\begin{aligned} & (\cancel{a} + \cancel{a^2} + \cancel{a^3} + \cancel{a^4} + \cancel{a^5} + \dots + \cancel{a^L} + a^{L+1}) + \\ & (-\cancel{a} - \cancel{a^2} - \cancel{a^3} - \cancel{a^4} - \cancel{a^5} - \dots - \cancel{a^L} - 1) = \\ & \hspace{30em} a^{L+1} - 1 \end{aligned}$$

$$\sum_{i=0}^L a^i = \frac{a^{L+1} - 1}{a - 1}$$

Finite Geometric Series

$$a < 1$$

Finite Geometric Series

$$a > 1$$

Today's Keywords

- Divide and Conquer
- Recurrences
- Merge Sort
- Karatsuba
- Tree Method

CLRS Readings

- Chapter 4

Homeworks

- HW0 due Tonight at 11pm
 - Submit both pdf and zip files!
- HW1 due Thursday, September 12 at 11pm
 - Start early!
 - Written (use Latex!) – Submit BOTH pdf and zip!
 - Asymptotic notation
 - Recurrences
 - Divide and Conquer

Homework Help Algorithm

- Algorithm: How to ask a question about homework (efficiently)
 1. Check to see if your question is already on piazza
 2. If it's not on piazza, ask on piazza
 3. Look for other questions you know the answer to, and provide answers to any that you see
 4. TA office hours
 5. Instructor office hours
 6. Email, set up a meeting

	Sun 8	Mon 9	Tue 10	Wed 11	Thu 12	Fri 13	Sat 14

Divide and Conquer*

- **Divide:**

- Break the problem into multiple **subproblems**, each smaller instances of the original

- **Conquer:**

- If the subproblems are “large”:
 - Solve each subproblem **recursively**
- If the subproblems are “small”:
 - Solve them directly (**base case**)

- **Combine:**

- Merge together solutions to subproblems

Analyzing Divide and Conquer

1. Break into smaller **subproblems**
2. Use **recurrence** relation to express recursive running time
3. Use **asymptotic** notation to simplify

- **Divide:** $D(n)$ time,
- **Conquer:** recurse on small problems, size s
- **Combine:** $C(n)$ time
- **Recurrence:**

$$\color{red}{\clubsuit} T(n) = D(n) + \sum T(s) + C(n)$$

Recurrence Solving Techniques

Tree

get a picture of recursion

Guess/Check

guess and use induction to prove

“Cookbook” *MAGIC!*

Substitution

substitute in to simplify

Merge Sort

- **Divide:**
 - Break n -element list into two lists of $n/2$ elements
- **Conquer:**
 - If $n > 1$:
 - Sort each sublist **recursively**
 - If $n = 1$:
 - List is already sorted (**base case**)
- **Combine:**
 - Merge together sorted sublists into one sorted list

Merge

- **Combine:** Merge sorted sublists into one sorted list
- We have:
 - 2 sorted lists (L_1, L_2)
 - 1 output list (L_{out})

While (L_1 and L_2 not empty):

 If $L_1[0] \leq L_2[0]$:

$L_{out}.append(L_1.pop())$

 Else:

$L_{out}.append(L_2.pop())$

$L_{out}.append(L_1)$

$L_{out}.append(L_2)$

$O(n)$

Analyzing Merge Sort

1. Break into smaller **subproblems**
2. Use **recurrence** relation to express recursive running time
3. Use **asymptotic** notation to simplify

- **Divide:** 0 comparisons
- **Conquer:** recurse on 2 small **subproblems**, size $\frac{n}{2}$
- **Combine:** n comparisons
- **Recurrence:**

$$\rightarrow T(n) = 2T\left(\frac{n}{2}\right) + n$$

Recurrence Solving Techniques

Tree

Guess/Check

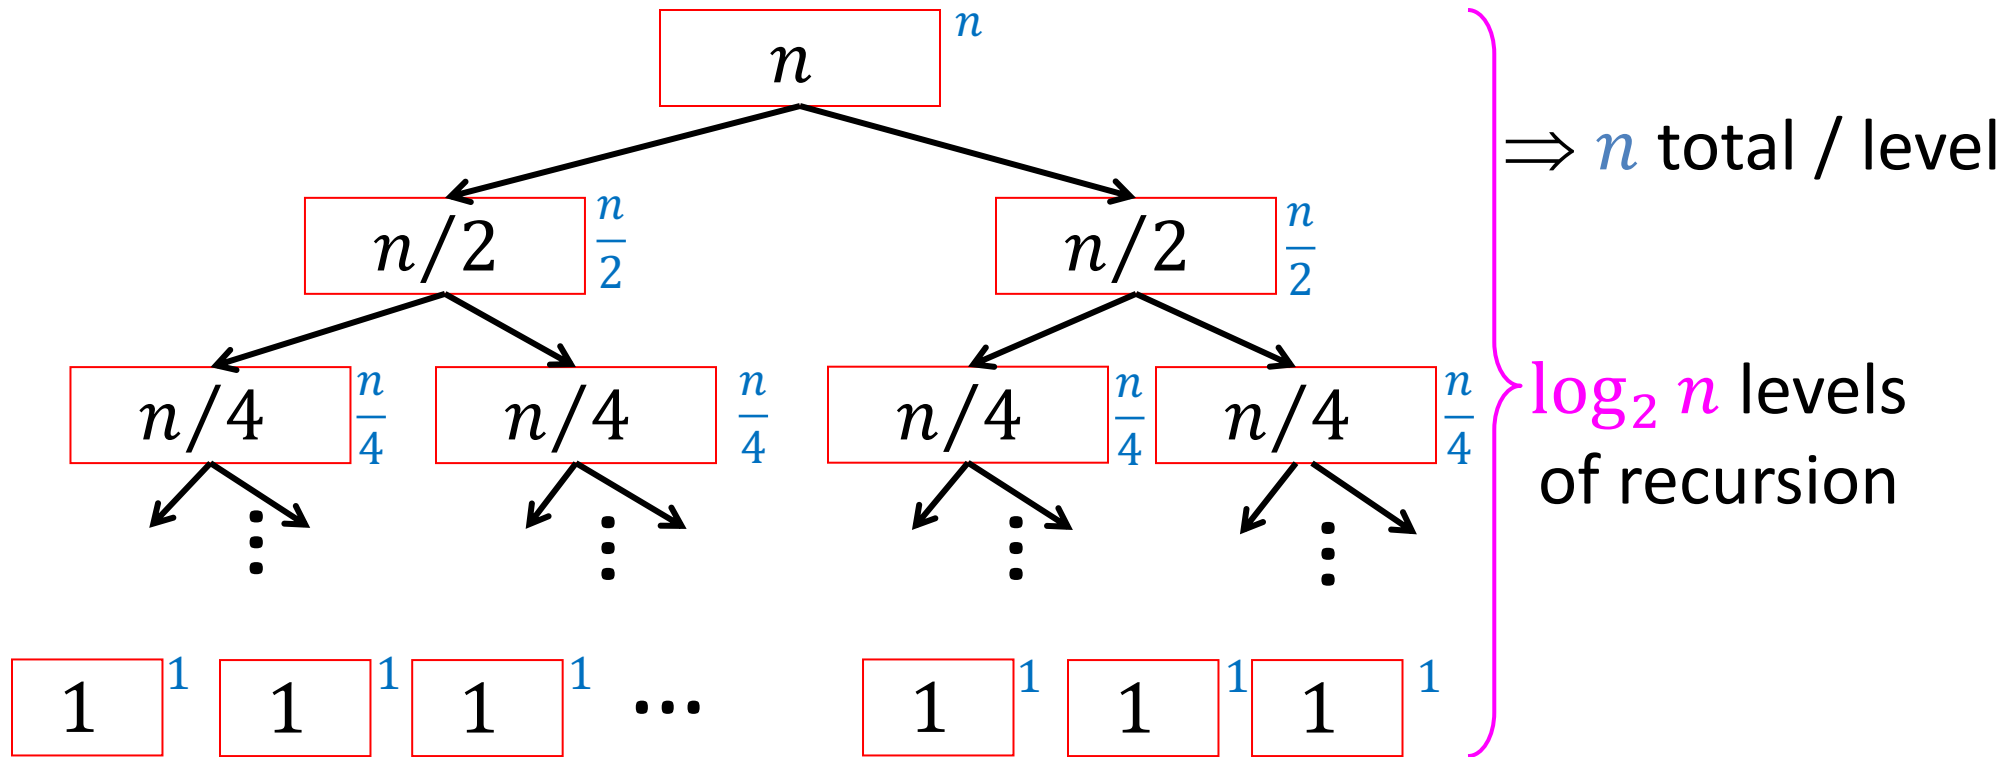

“Cookbook”

Substitution

Tree method

$$T(n) = 2T\left(\frac{n}{2}\right) + n$$

$$T(n) = \sum_{i=1}^{\log_2 n} n = n \log_2 n$$

Multiplication

- Want to multiply large numbers together

$$\begin{array}{r} 4102 \\ \times 1819 \\ \hline \end{array} \quad n\text{-digit numbers}$$

- What makes a “good” algorithm?
- How do we measure input size?
- What do we “count” for run time?

“Schoolbook” Method

Can we do better?

How many total multiplications?

$$\begin{array}{r} 4102 \\ \times 1819 \\ \hline 36918 \\ 4102 \\ 32816 \\ + 4102 \\ \hline 7461538 \end{array}$$

n -digit numbers

What about cost of additions?
 $\Theta(n^2)$

n mults
 n mults
 n mults
 n mults

n levels
 $\Rightarrow \Theta(n^2)$

Divide and Conquer

Divide and Conquer method

1. Break into smaller subproblems

$a=41$
 $b=02$

$$\begin{array}{r} \begin{array}{cc} \boxed{a} & \boxed{b} \\ \times \boxed{c} & \boxed{d} \\ \hline \end{array} & = & \begin{array}{c} 100 \times 41 \\ + 02 \\ \hline \end{array} \begin{array}{c} 10^{\overline{2}} \boxed{a} \\ + \boxed{b} \\ \hline \end{array} \\ & & \begin{array}{c} 10^{\overline{2}} \boxed{c} \\ + \boxed{d} \\ \hline \end{array} \\ & & \begin{array}{c} 4100 \\ + 02 \\ \hline \end{array} \end{array}$$
$$10^n (\boxed{a} \times \boxed{c}) +$$
$$10^{\overline{2}} (\boxed{a} \times \boxed{d} + \boxed{b} \times \boxed{c}) +$$
$$(\boxed{b} \times \boxed{d})$$

Divide and Conquer Multiplication

- **Divide:**

- Break n -digit numbers into four numbers of $n/2$ digits each (call them a, b, c, d)

- **Conquer:**

- If $n > 1$:

- Recursively compute ac, ad, bc, bd

- If $n = 1$: (i.e. one digit each)

- Compute ac, ad, bc, bd directly (base case)

- **Combine:**

- $10^n(ac) + 10^{\frac{n}{2}}(ad + bc) + bd$

Divide and Conquer method

2. Use **recurrence** relation to express recursive running time

$$10^n (ac) + 10^{\frac{n}{2}} (ad + bc) + bd$$

Recursively solve

$$T(n) = 4T\left(\frac{n}{2}\right) + 5n$$

Divide and Conquer method

3. Use **asymptotic** notation to simplify

$$T(n) = 4T\left(\frac{n}{2}\right) + 5n$$

$$T(n) = 5n \sum_{i=0}^{\log_2 n} 2^i$$

Divide and Conquer method

3. Use **asymptotic** notation to simplify

$$T(n) = 4T\left(\frac{n}{2}\right) + 5n$$

$$T(n) = 5n \sum_{i=0}^{\log_2 n} 2^i$$

$$T(n) = 5n \frac{2^{\log_2 n + 1} - 1}{2 - 1}$$

$$T(n) = 5n(2n - 1) = \Theta(n^2)$$

$$\sum_{i=0}^{\log_2 n} 2^i$$
$$\sum_{i=0}^L a^i = \frac{a^{L+1} - 1}{a - 1}$$

$$a = 2 \quad L = \log_2 n$$

$$2^{\log_2 n + 1} = 2 \cdot 2^{\log_2 n}$$
$$= 2n$$

Karatsuba

1. Break into smaller **subproblems**

$$\begin{array}{r} \boxed{a} \boxed{b} \\ \times \boxed{c} \boxed{d} \\ \hline \end{array} = 10^{\frac{n}{2}} \boxed{a} + \boxed{b} \\ = 10^{\frac{n}{2}} \boxed{c} + \boxed{d}$$
$$10^n (\boxed{a} \times \boxed{c}) +$$
$$10^{\frac{n}{2}} (\boxed{a} \times \boxed{d} + \boxed{b} \times \boxed{c}) +$$
$$(\boxed{b} \times \boxed{d})$$

Karatsuba

$$\begin{array}{r} \boxed{a} \boxed{b} \\ \times \boxed{c} \boxed{d} \\ \hline \end{array}$$

$$10^n \boxed{ac} + 10^{\frac{n}{2}} \boxed{ad + bc} + \boxed{bd}$$

Can't avoid these

This can be
simplified

$$(a + b)(c + d) =$$

$$\boxed{ac} + \boxed{ad + bc} + \boxed{bd}$$

$$\boxed{ad + bc} = \boxed{(a + b)(c + d) - \boxed{ac} - \boxed{bd}}$$

Two
multiplications

One multiplication

$$\begin{array}{r} \boxed{a} \quad \boxed{b} \\ \times \boxed{c} \quad \boxed{d} \\ \hline \end{array}$$

Karatsuba

2. Use **recurrence** relation to express recursive running time

$$10^n \boxed{ac} + 10^{\frac{n}{2}} \left(\boxed{(a+b)(c+d)} - ac - bd \right) + \boxed{bd}$$

Recursively solve

$$T(n) = 3T\left(\frac{n}{2}\right) + 8n$$

Karatsuba

- **Divide:**

- Break n -digit numbers into four numbers of $n/2$ digits each (call them a, b, c, d)

- **Conquer:**

- If $n > 1$:

- Recursively compute $ac, bd, (a + b)(c + d)$

- If $n = 1$:

- Compute $ac, bd, (a + b)(c + d)$ directly (base case)

- **Combine:**

- $10^n(ac) + 10^{\frac{n}{2}}((a + b)(c + d) - ac - bd) + bd$

Karatsuba Algorithm

1. Recursively compute: $ac, bd, (a + b)(c + d)$
2. $(ad + bc) = (a + b)(c + d) - ac - bd$
3. Return $10^n(ac) + 10^{\frac{n}{2}}(ad + bc) + bd$

Pseudocode

1. $x \leftarrow \text{Karatsuba}(a, c)$
2. $y \leftarrow \text{Karatsuba}(b, d)$
3. $z \leftarrow \text{Karatsuba}(a + b, c + d) - x - y$
4. Return $10^n x + 10^{n/2} z + y$

$$T(n) = 3T\left(\frac{n}{2}\right) + 8n$$

Karatsuba

3. Use asymptotic notation to simplify

$$T(n) = 3T\left(\frac{n}{2}\right) + 8n$$

$$T(n) = 8n \sum_{i=0}^{\log_2 n} \left(\frac{3}{2}\right)^i$$

$$8n \cdot 1$$

$$8n \cdot \frac{3}{2}$$

$$8n \cdot \frac{9}{4}$$

$$\vdots$$

$$8n \cdot \frac{3^{\log_2 n}}{2^{\log_2 n}}$$

Karatsuba

3. Use **asymptotic** notation to simplify

$$T(n) = 3T\left(\frac{n}{2}\right) + 8n$$

$$T(n) = 8n \sum_{i=0}^{\log_2 n} \left(\frac{3}{2}\right)^i$$

$$T(n) = 8n \frac{\left(\frac{3}{2}\right)^{\log_2 n + 1} - 1}{\frac{3}{2} - 1}$$

Math, math, and more math...(on board, see lecture supplement)

Karatsuba

3. Use **asymptotic** notation to simplify

$$T(n) = 3T\left(\frac{n}{2}\right) + 8n$$

$$T(n) = 8n \sum_{i=0}^{\log_2 n} (3/2)^i$$

$$T(n) = 8n \frac{(3/2)^{\log_2 n + 1} - 1}{3/2 - 1}$$

Math, math, and more math...(on board, see lecture supplement)

$$\begin{aligned} T(n) &= 24(n^{\log_2 3}) - 16n = \Theta(n^{\log_2 3}) \\ &\approx \Theta(n^{1.585}) \end{aligned}$$
