

CS6160 Theory of Computation

Problem Set 2

Department of Computer Science, University of Virginia

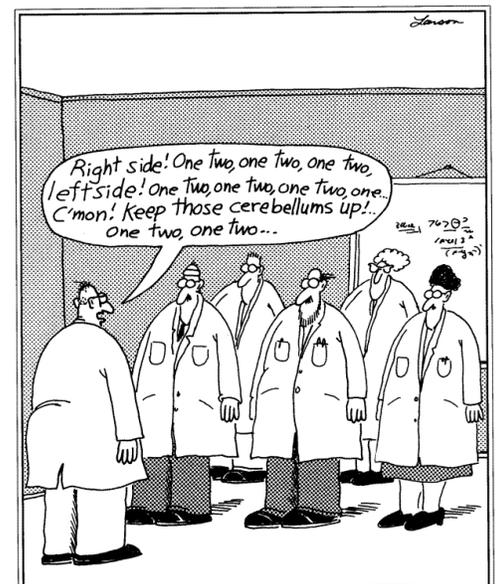

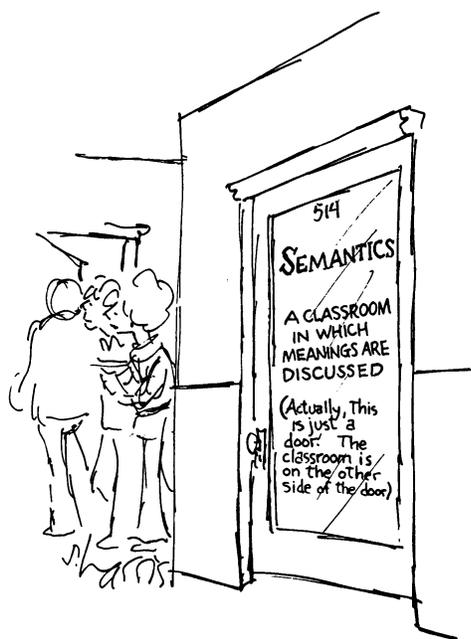

Gabriel Robins

Please start solving these problems immediately, don't procrastinate, and work in study groups. Please prove all your answers; informal arguments are acceptable, but please make them precise / detailed / convincing enough so that they can be easily made rigorous if necessary. To review notation and definitions, please read the "[Basic Concepts](#)" summary posted on the [class Web site](#), and also read the corresponding chapters from the [Sipser textbook](#) and Polya's "[How to Solve It](#)".

Please **do not simply copy answers that you do not fully understand**; on homeworks and on exams we reserve the right to ask you to explain any of your answers verbally in person (and we have exercised this option in the past). Please familiarize yourself with the [UVa Honor Code](#) as well as with the course Cheating Policy summarized on page 3 of the [Course Syllabus](#). To fully understand and master the material of this course typically requires an average effort of at least six to ten hours per week, as well as regular meetings with the TAs and attendance of the weekly problem-solving sessions.

This is not a "due homework", but rather a "pool of problems" meant to calibrate the scope and depth of the knowledge / skills in CS theory that you (eventually) need to have for the course exams, becoming a better problem-solver, be able to think more abstractly, and growing into a more effective computer scientist. You don't necessarily have to completely solve every last question in this problem set (although it would be great if you did!). Rather, please solve as many of these problems as you can, and use this problem set as a resource to improve your problem-solving skills, hone your abstract thinking, and to find out what topics you need to further focus on and learn more deeply. Recall that most of the midterm and final exam questions in this course will come from these problem sets, so your best strategy of studying for the exams in this course is to solve (including in study groups) as many of these problems as possible, and the sooner the better!

Advice: Please try to solve the easier problems first (where the meta-problem here is to figure out which are the easier ones ☺). Don't spend too long on any single problem without also attempting (in parallel) to solve other problems as well. This way, solutions to the easier problems (at least easier for you) will reveal themselves much sooner (think about this as a "hedging strategy" or "dovetailing strategy").

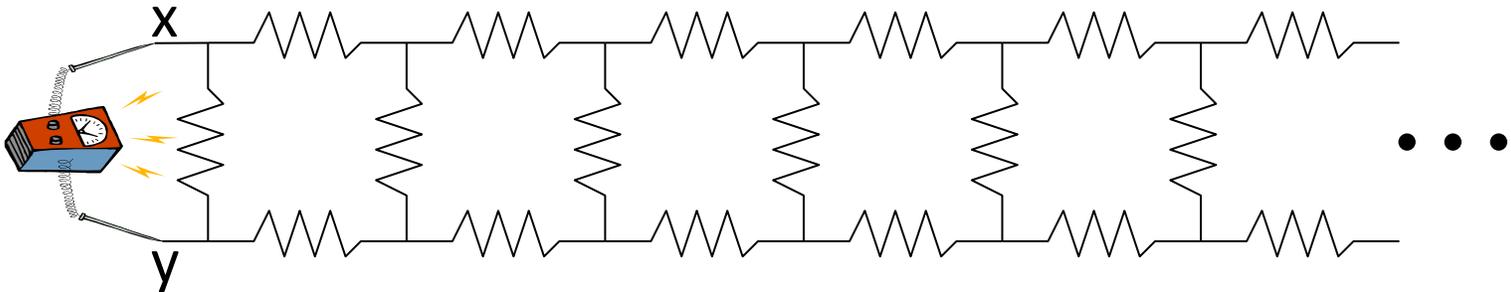

Brain aerobics

- Solve the following equation for X:

$$X^{X^{X^{X^{\dots}}}} = 2$$

where the stack of exponentiated x's extends forever.

- For the following infinite ladder of resistors (of resistance R each), what is the resistance measured between points x and y?

- How do the above two problems (#1 and #2) relate to Cantor's "infinite hotel" -type scenarios?
- A man leaves his house and walks one mile south. He then walks one mile west and sees a Bear. Then he walks one mile north and ends up back at his house. What color was the bear?
- Characterize the complete set of locations where the scenario above (#4) can happen.
- What is the approximate value of $[1 + 9^{-(4^{(7 \cdot 6)})}]^{(3^{(2^{85})})}$?
